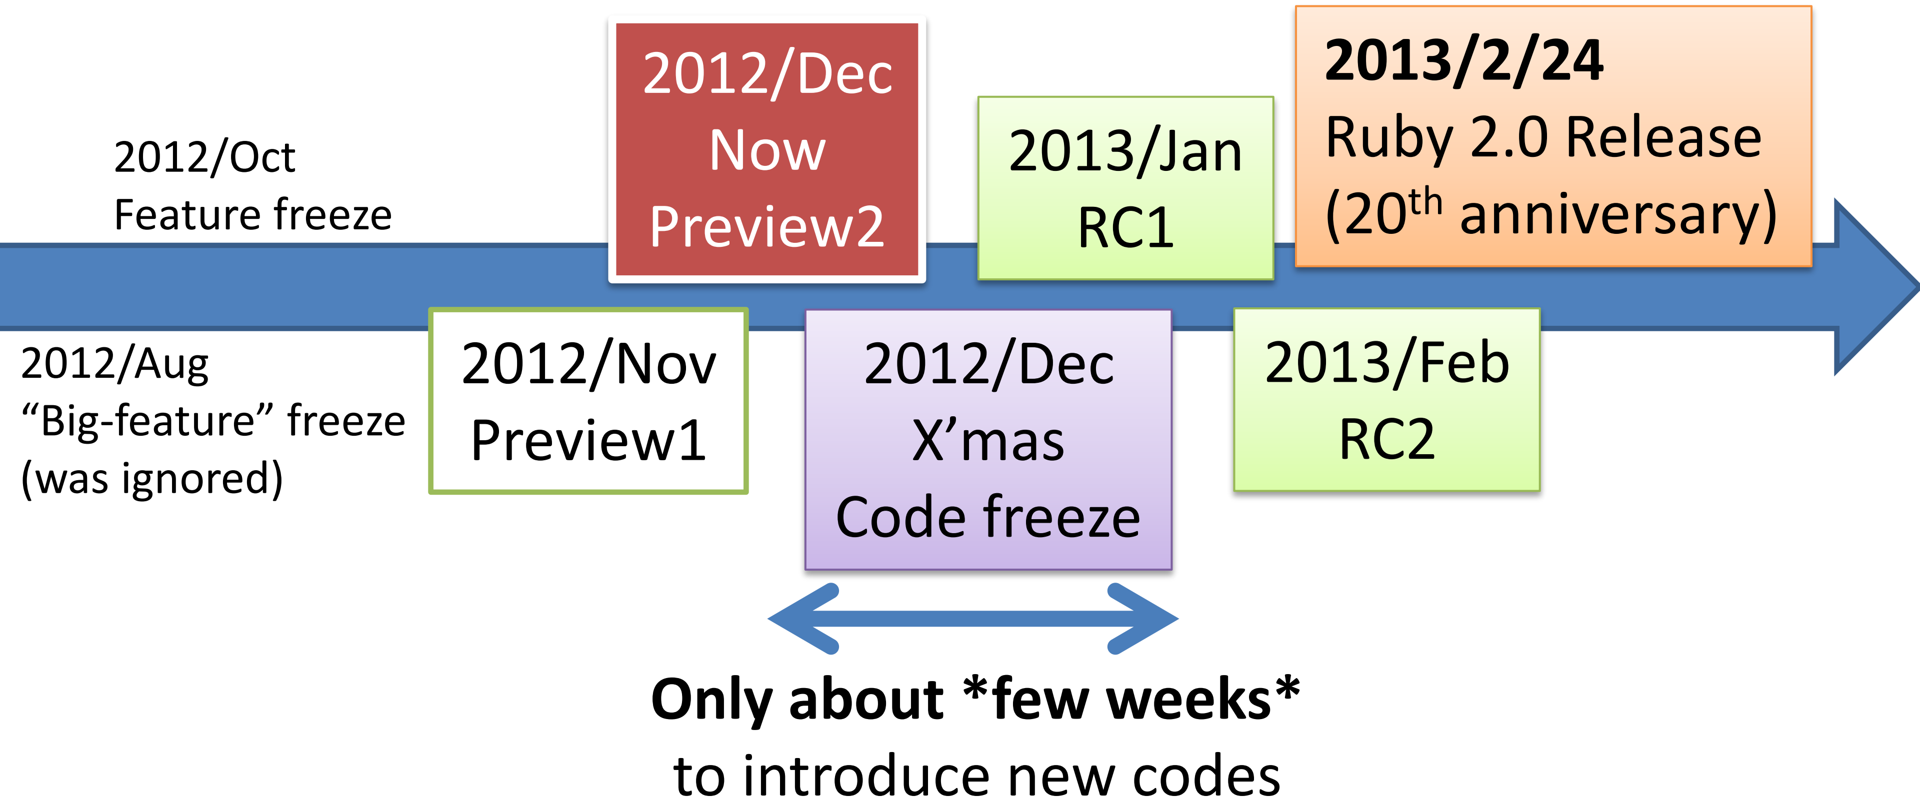
Ruby 2.0 Roadmap



“[ruby-core:40301] A rough release schedule for 2.0.0” and Endo-san’s (release manager) leak

Introduction of Ruby 2.0 features

What features are introduced?

You can read them at NEWS file

-*- rdoc -*-

= NEWS for Ruby 2.0.0

This document is a list of user visible feature changes made between releases except for bug fixes.

Note that each entry is kept so brief that no reason behind or reference information is supplied with. For a full list of changes with all sufficient information, see the ChangeLog file.

== Changes since the 1.9.3 release

=== C API updates
* NUM2SHORT() and NUM2USHORT() added. They are similar to NUM2INT, but short.
* rb_newobj_of() and NEWOBJ_OF() added. They create a new object of a given class.

=== Library updates (outstanding ones only)

* builtin classes

* Array
  * added method:
    * added Array#bsearch for binary search.
  * incompatible changes:
    * random parameter of Array#shuffle! and Array#sample now will be called with one argument, maximum value.
    * when given Range arguments, Array#values_at now returns nil for each value that is out-of-range.

* Enumerable
  * added method:
    * added Enumerable#lazy method for lazy enumeration.

* Enumerator
  * added method:
    * added Enumerator#size for lazy size evaluation.
  * extended method:
    * Enumerator.new accept an argument for lazy size evaluation.

* ENV
  * aliased method:
    * ENV.to_h is a new alias for ENV.to_hash

* Fiber
  * incompatible changes:
    * Fiber#resume cannot resume a fiber which invokes "Fiber#transfer".

* File
  * extended method:
    * File.fnmatch? now expands braces in the pattern if File::FNM_EXTGLOB option is given.

* GC
  * improvements:
    * introduced the bitmap marking which suppresses to copy a memory page with Copy-on-Write.
    * introduced the non-recursive marking which avoids unexpected stack overflow.

* GC::Profiler
  * added method:
    * added GC::Profiler.raw_data which returns raw profile data for GC.

* Hash
  * added method:
    * added Hash#to_h as explicit conversion method, like Array#to_a.
  * extended method:
    * Hash#default_proc= can be passed nil to clear the default proc.

* Kernel
  * added method:
    * added Kernel#Hash conversion method like Array() or Float().
    * added Kernel#using, which imports refinements into the current scope. [experimental]
    * added Kernel#__dir__ which returns a current dirname.
    * added Kernel#caller_locations which returns an array of frame information objects.
  * extended method:
    * Kernel#warn accepts multiple args in like puts.
    * Kernel#caller accepts second optional argument `n' which specify required caller size.
    * Kernel#to_enum and enum_for accept a block for lazy size evaluation.
  * incompatible changes:
    * system() and exec() closes non-standard file descriptors (The default of :close_others option is changed to true by default.)
    * respond_to? against a protected method now returns false unless the second argument is true.
    * __callee__ has returned to the original behavior, and now returns the called name but not the original name in an aliased method.
    * Kernel#inspect does not call #to_s anymore (it used to call redefined #to_s).

* LoadError
  * added method:
    * added LoadError#path method to return the file name that could not be loaded.

* Module
  * added method:
    * added Module#prepend which is similar to Module#include, however a method in the prepended module overrides the corresponding method in the prepending module.
    * added Module#refine, which extends a class or module locally. [experimental]
    * added Module#refinements, which returns refinements defined in the receiver. [experimental]
    * added Module#using, which imports refinements into the receiver. [experimental]
  * extended method:
    * Module#define_method accepts a UnboundMethod from a Module.
    * Module#const_get accepts a qualified constant string, e.g. Object.const_get("Foo::Bar::Baz")

* Mutex
  * added method:
    * added Mutex#owned? which returns the mutex is held by current thread or not. [experimental]
  * incompatible changes:
    * Mutex#lock, Mutex#unlock, Mutex#try_lock, Mutex#synchronize and Mutex#sleep are no longer allowed to be used from trap handler and raise a ThreadError in such case.
    * Mutex#sleep may spurious wakeup. Check after wakeup.

* NilClass
  * added method:
    * added nil.to_h which returns {}

* Process
  * added method:
    * added getsid for getting session id (unix only).

* Range
  * added method:
    * added Range#size for lazy size evaluation.
    * added Range#bsearch for binary search.

* Signal
  * added method:
    * added Signal.signame which returns signal name
  * incompatible changes:
    * Signal.trap raises ArgumentError when :SEGV, :BUS, :ILL, :FPE, :VTALRM are specified.

* String
  * added method:
    * added String#b returning a copied string whose encoding is ASCII-8BIT.
  * change return value:
    * String#lines now returns an array instead of an enumerator.
    * String#chars now returns an array instead of an enumerator.
    * String#codepoints now returns an array instead of an enumerator.
    * String#bytes now returns an array instead of an enumerator.

* Struct
  * added method:
    * added Struct#to_h returning values with keys corresponding to the instance variable names.

* Thread
  * added method:
    * added Thread#thread_variable_get for getting thread local variables (these are different than Fiber local variables).
    * added Thread#thread_variable_set for setting thread local variables.
    * added Thread#thread_variables for getting a list of the thread local variable keys.
    * added Thread#thread_variable? for testing to see if a particular thread variable has been set.
    * added Thread#backtrace_locations which returns similar information of Kernel#caller_locations.
  * incompatible changes:
    * Thread#join and Thread#value now raises a ThreadError if target thread is the current or main thread.

* Time
  * change return value:
    * Time#to_s returned encoding defaults to US-ASCII but automatically transcodes to Encoding.default_internal if it is set.

* TracePoint
  * new class. This class is replacement of set_trace_func. Easy to use and efficient implementation.

* toplevel
  * added method:
    * added main.define_method which defines a global function.

* cgi
  * Add HTML5 tag maker.
  * CGI#header has been renamed to CGI#http_header and CGI#header is aliased to CGI#header.
  * When HTML5 tagmaker called, overwrite CGI#header, CGI#header function is to create a <header> element.

* iconv
  * Iconv has been removed. Use String#encode instead.

* io/wait
  * new features:
    * added IO#wait_writable method.
    * added IO#wait_readable method as alias of IO#wait.

* net/http
  * new features:
    * Proxies are now automatically detected from the http_proxy environment variable. See Net::HTTP::new for details.
    * gzip and deflate compression are now requested for all requests by default. See Net::HTTP for details.
    * SSL sessions are now reused across connections for a single instance. This speeds up connection by using a previously negotiated session.
  * new methods:
    * Net::HTTP#local_host
    * Net::HTTP#local_host=
    * Net::HTTP#local_port
    * Net::HTTP#local_port=
  * extended method:
    * Net::HTTP#connect uses local_host and local_port if specified.

* net/imap
  * new methods:
    * Net::IMAP.default_port
    * Net::IMAP.default_imap_port
    * Net::IMAP.default_tls_port
    * Net::IMAP.default_ssl_port
    * Net::IMAP.default_imaps_port

* objspace
  * new method:
    * ObjectSpace.reachable_objects_from(obj)

* openssl
  * Consistently raise an error when trying to encode nil values. All instances of OpenSSL::ASN1::Primitive now raise TypeError when calling to_der on an instance whose value is nil. All instances of OpenSSL::ASN1::Constructive raise NoMethodError in the same case. Constructing such values is still permitted.
  * TLS 1.1 & 1.2 support by setting OpenSSL::SSL::SSLContext#ssl_version to :TLSv1_2, :TLSv1_2_server, :TLSv1_2_client or :TLSv1_1, :TLSv1_1_server :TLSv1_1_client. The version being effectively used can be queried with OpenSSL::SSL#ssl_version. Furthermore, it is also possible to blacklist the new TLS versions with OpenSSL::SSL:OP_NO_TLSv1_1 and OpenSSL::SSL::OP_NO_TLSv1_2.
  * Added OpenSSL::SSL::SSLContext#renegotiation_cb. A user-defined callback may be set which gets called whenever a new handshake is negotiated. This also allows to programmatically decline (client) renegotiation attempts.
  * Support for "0/n" splitting of records as BEAST mitigation via OpenSSL::SSL::OP_DONT_INSERT_EMPTY_FRAGMENTS.
  * OpenSSL requires passwords for decrypting PEM-encoded files to be at least four characters long. This led to awkward situations where an export with a password with fewer than four characters was possible, but accessing the file afterwards failed. OpenSSL::PKey::RSA, OpenSSL::PKey::DSA and OpenSSL::PKey::EC therefore now enforce the same check when exporting a private key to PEM with a password - it has to be at least four characters long.
  * SSL/TLS support for the Next Protocol Negotiation extension. Supported with OpenSSL 1.0.1 and higher.
  * OpenSSL::OPENSSL_FIPS allows client applications to detect whether OpenSSL is running in FIPS mode and to react to the special requirements this might imply.

* ostruct
  * new methods:
    * OpenStruct#[], []=
    * OpenStruct#each_pair
    * OpenStruct#eql?
    * OpenStruct#hash
    * OpenStruct#to_h converts the struct to a hash.
  * extended method:
    * OpenStruct.new also accepts an OpenStruct / Struct.

* pathname
  * extended method:
    * Pathname#find returns an enumerator if no block is given.

* rake
  * rake has been updated to version 0.9.5.

This version is backwards-compatible with previous rake versions and contains many bug fixes.

See http://rake.rubyforge.org/doc/release_notes/rake-0_9_5_rdoc.html for a list of changes in rake 0.9.3, 0.9.4 and 0.9.5.

* rdoc
  * rdoc has been updated to version 4.0

This version is largely backwards-compatible with previous rdoc versions. The most notable change is an update to the ri data format (ri data must be regenerated for gems shared across rdoc versions). Further API changes are internal and won't affect most users.

See https://github.com/rdoc/rdoc/blob/master/History.rdoc for a list of changes in rdoc 4.0.

* resolv
  * new methods:
    * Resolv::DNS#timeouts=
    * Resolv::DNS::Config#timeouts=

* rexml
  * REXML::Document#write supports Hash arguments.
  * REXML::Document#write supports new :encoding option. It changes XML document encoding. Without :encoding option, encoding in XML declaration is used for XML document encoding.

* RubyGems
  * Updated to 2.0.0.preview2

RubyGems 2.0.0 features the following improvements:

* Improved support for default gems shipping with ruby 2.0.0+
* A gem can have arbitrary metadata through Gem::Specification#metadata
* `gem search` now defaults to --remote and is anchored like gem list.
* Added --document to replace --rdoc and --ri. Use --no-document to disable documentation, --document=rdoc to only generate rdoc.
* Only ri-format documentation is generated by default.
* `gem server` uses RDoc::Servlet from RDoc 4.0 to generate HTML documentation.

For an expanded list of updates and bug fixes see:

https://github.com/rubygems/rubygems/blob/master/History.txt

* shellwords
  * Shellwords#shellescape() now stringifies the given object using to_s.
  * Shellwords#shelljoin() accepts non-string objects in the given array, each of which is stringified using to_s.

* syslog
  * Added Syslog::Logger which provides a Logger API atop Syslog.
  * Syslog::Priority, Syslog::Level, Syslog::Option and Syslog::Macros are introduced for easy detection of available constants on a running system.

* tmpdir
  * incompatible changes:
    * Dir.mktmpdir uses FileUtils.remove_entry instead of FileUtils.remove_entry_secure. This means that applications should not change the permission of the created temporary directory to make accessible from other users.

* yaml
  * Syck has been removed. YAML now completely depends on libyaml being installed.

* zlib
  * Added streaming support for Zlib::Inflate and Zlib::Deflate. This allows processing of a stream without the use of large amounts of memory.
  * Added support for the new deflate strategies Zlib::RLE and Zlib::FIXED.
  * Zlib streams are now processed without the GVL. This allows gzip, zlib and deflate streams to be processed in parallel.

=== Language changes

* Added %i and %I for symbol list creation (similar to %w and %W).

* Default source encoding is changed to UTF-8. (was US-ASCII)

=== Compatibility issues (excluding feature bug fixes)

* Array#values_at

See above.

* String#lines
* String#chars
* String#codepoints
* String#bytes

These methods no longer return an Enumerator, although passing a block is still supported for backwards compatibility.

Code like str.lines.with_index(1) { |line, lineno| ... } no longer works because str.lines returns an array. Replace lines with each_line in such cases.

* Signal.trap

See above.

* Merge Onigmo. https://github.com/k-takata/Onigmo

* The :close_others option is true by default for system() and exec(). Also, the close-on-exec flag is set by default for all new file descriptors. This means file descriptors doesn't inherit to spawned process unless explicitly requested such as system(..., fd=>fd).

* Kernel#respond_to? against a protected method now returns false unless the second argument is true.

* Dir.mktmpdir in lib/tmpdir.rb

See above.

* OpenStruct new methods can conflict with custom attributes named "each_pair", "eql?", "hash" or "to_h".

* Thread#join, Thread#value

See above.

* Mutex#lock, Mutex#unlock, Mutex#try_lock, Mutex#synchronize and Mutex#sleep

See above.

Doubled from Nov/2012

Ruby 2.0 Main features

- Traces
  - TracePoint
  - DTrace
- Inspection
  - caller_locations
  - debug_inspector API
- Memory inspection
  - ObjectSpace.reachable_objects_from(obj)
  - GC.stat[:total_allocated_object]

Ruby 2.0 introduces huge inspection support

Internal Inspection features

- Generally, you don't need to use these inspection features
- If you got a trouble, please remember inspection features

Nobody knows, so I introduce them today

TracePoint

- OO designed set_trace_func
- Usage

```
# old style
set_trace_func(lambda{|ev,file,line,id,klass,binding|
  puts "#{ev} #{file}:#{line}"
}

# new style with TracePoint
trace = TracePoint.trace{|tp|
  # access event info by methods
  puts "#{tp.event}, #{tp.path}:#{tp.line}"
}
```

TracePoint
Flexible on/off

```
trace = TracePoint.new{...}
trace.enable do
  ... # enable trace only in this block
end
trace.enabe # enable trace after this point
trace.disalbe{
  ... # disable trace only in this block
}
```

TracePoint
Events

- Same as set_trace_func
  - line
  - call/return, c_call/c_return
  - class/end
  - raise
- New events (only for TracePoint)
  - thread_begin/thread_end
  - b_call/b_end

TracePoint
Filtering events

- TracePoint.new(events) only hook "events"

```
TracePoint.trace(:call, :return){...}
...
```

TracePoint
Event info

- Same as set_trace_func
  - event
  - path, lineno
  - defined_class, method_id
  - binding
- New event info
  - return_value (only for retun, c_return, b_return)
  - raised_exception (only for raise)

TracePoint Advantages

- Advantage of TracePoint compared with set_trace_func
  - OO style
  - On/Off
  - **Lightweight**
    - Creating binding object each time is too costly
  - Event filtering

DTrace

- Solaris, MacOSX FreeBSD and Linux has DTrace tracing features
- Ruby interpreter support some events
- See https://bugs.ruby-lang.org/projects/ruby/wiki/DTraceProbes
  - Not stable. Be careful this probe spec can be changed before and after Ruby 2.0 release.

Skip this section because I'm not an expert.

caller_locations

- caller() returns Backtrace strings array.
  - like ["t.rb:1:in `<main>'"]
- caller_locations() retuns OO style backtrace information
  - caller_locations(0).each{|loc|
    p "#{loc.path}:#{loc.lineno}“}
  - No need to parse Backtrace string!
- [advanced] caller and caller_locations support range and 2nd argument like Array#[] to specify how many backtrace information are needed

Debug inspection API

- Returns all bindings of current stack
  - Provided as C API
  - Debugger can use them

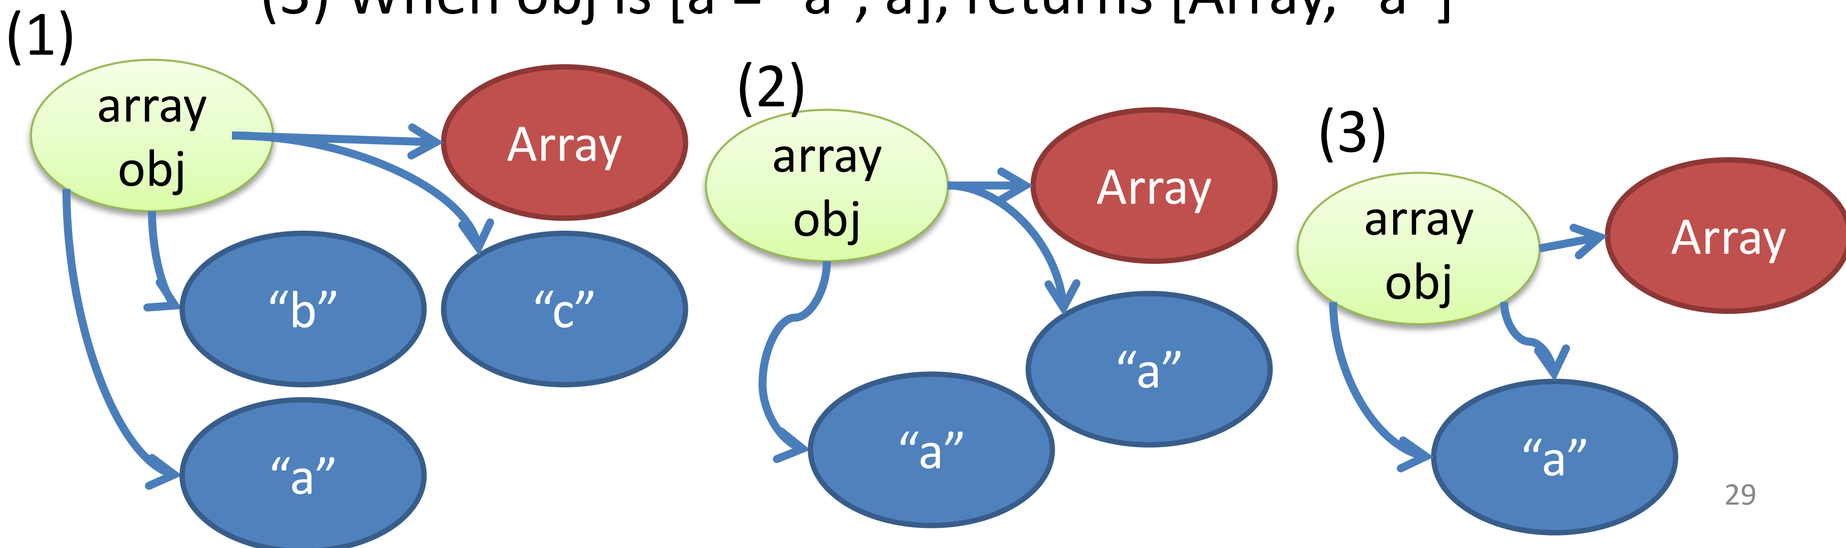
Memory inspection ObjectSpace.reachable_objects_from

- ObjectSpace.reachable_objects_from(obj) returns reachable objects
  - Examples:

    (1) When obj is [“a”, “b”, “c”], returns [Array, “a”, “b”, “c”]

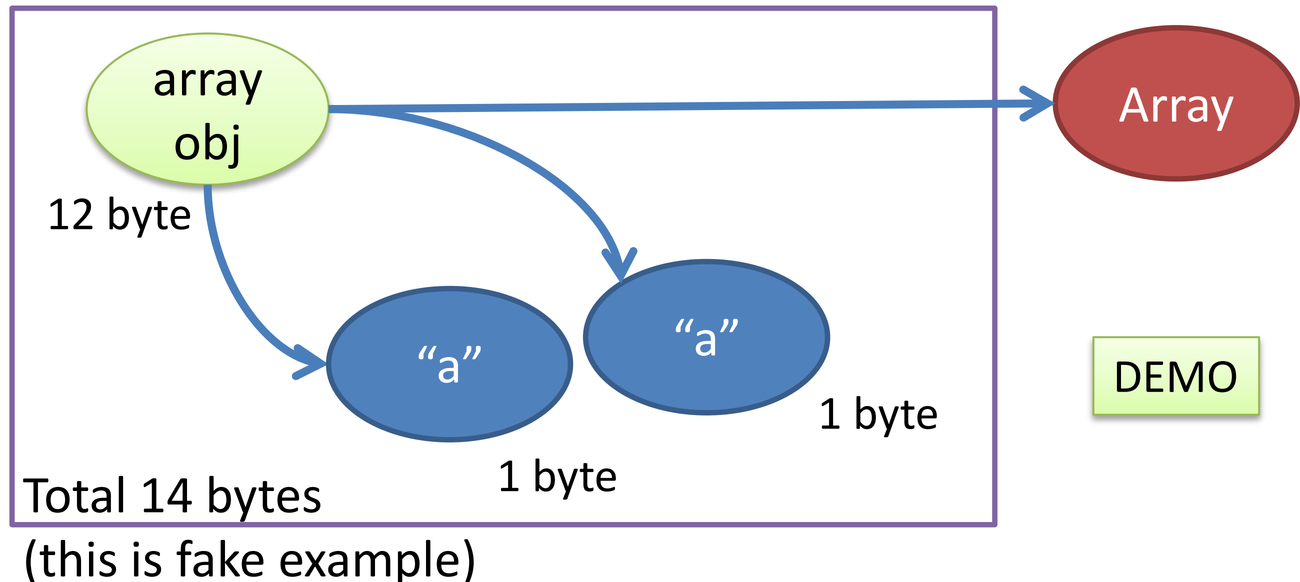
    (2) When obj is [“a”, “a”], returns [Array, “a”, “a”]

    (3) When obj is [a = “a”, a], returns [Array, “a”]



Memory inspection ObjectSpace.reachable_objects_from

- You can analyze memory leak. ... Maybe.
- Combination with ObjectSpace.memsize_of() (introduced at 1.9) is also helpful to calculate how many memories consumed by obj.

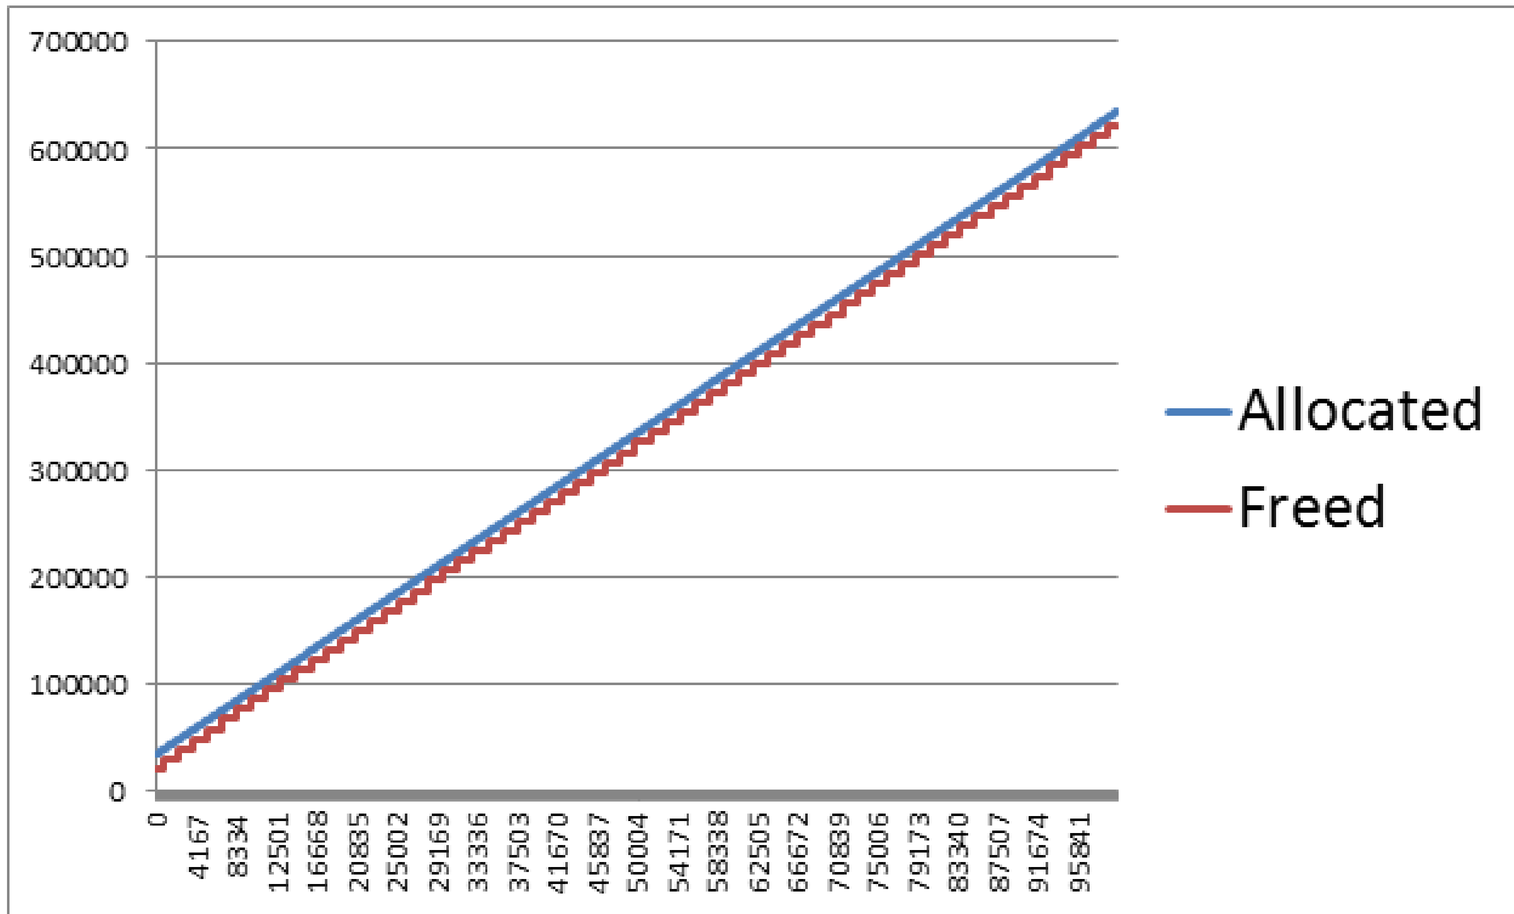


Memory inspection GC.stat[:total_allocated_object]

- GC.stat returns implementation dependent GC (memory) usage by hash
  - :count means how many GC occurs
- From 2.0, two information are added
- :total_allocated_object
  - How many objects are allocated since interpreter launched
- :total_freeed_object
  - How many objects are freed by GC.

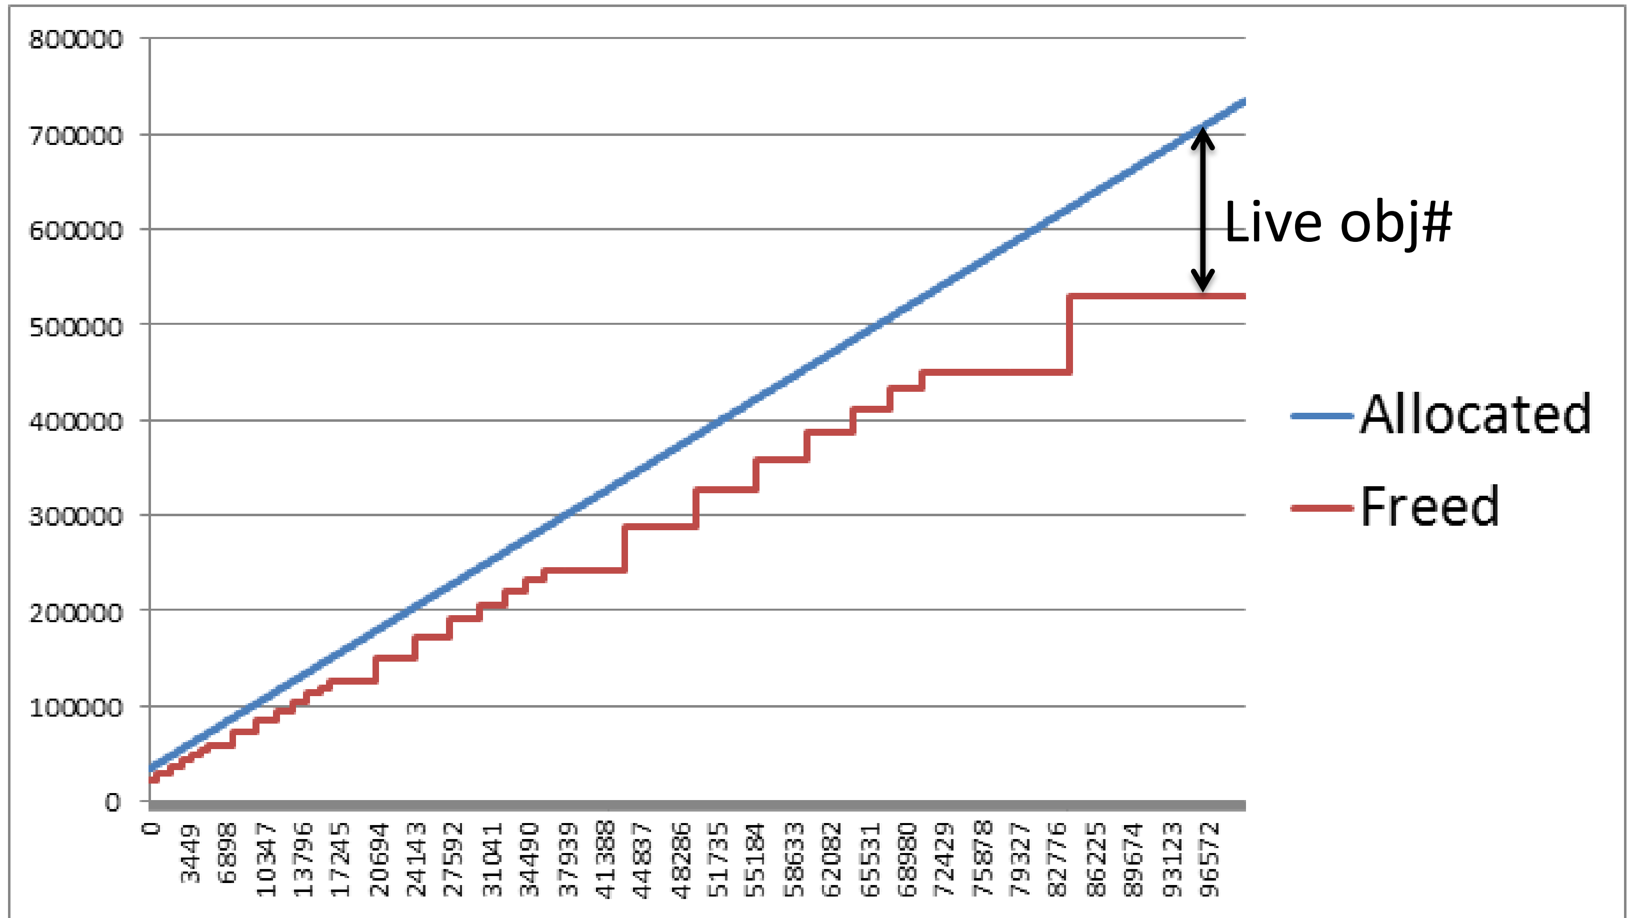
– Note that these numbers can be overflow.

Desirable behavior



```
100_000.times{|i| ""; # Generate an empty string
h = GC.stat
puts "#{i}¥t#{h[:total_allocated_object]}¥t#{h[:total_freed_object]}"}
```

Leakey behavior



```
ary = []
100_000.times{|i| ary << "" # generate an empty string and store (leak)
h = GC.stat
puts "#{i}¥t#{h[:total_allocated_object]}¥t#{h[:total_freed_object]}"}
```

Internal Inspection features Again

- Generally, you don’t need to use these inspection features
- If you got a trouble, please remember inspection features

How to make interpreter?
#3 Method dispatch

Prof. Koichi Sasada (*1)
Akihabara University (*2)

*1: Prof. means ...

*2: Of course, joking. No such University ☺

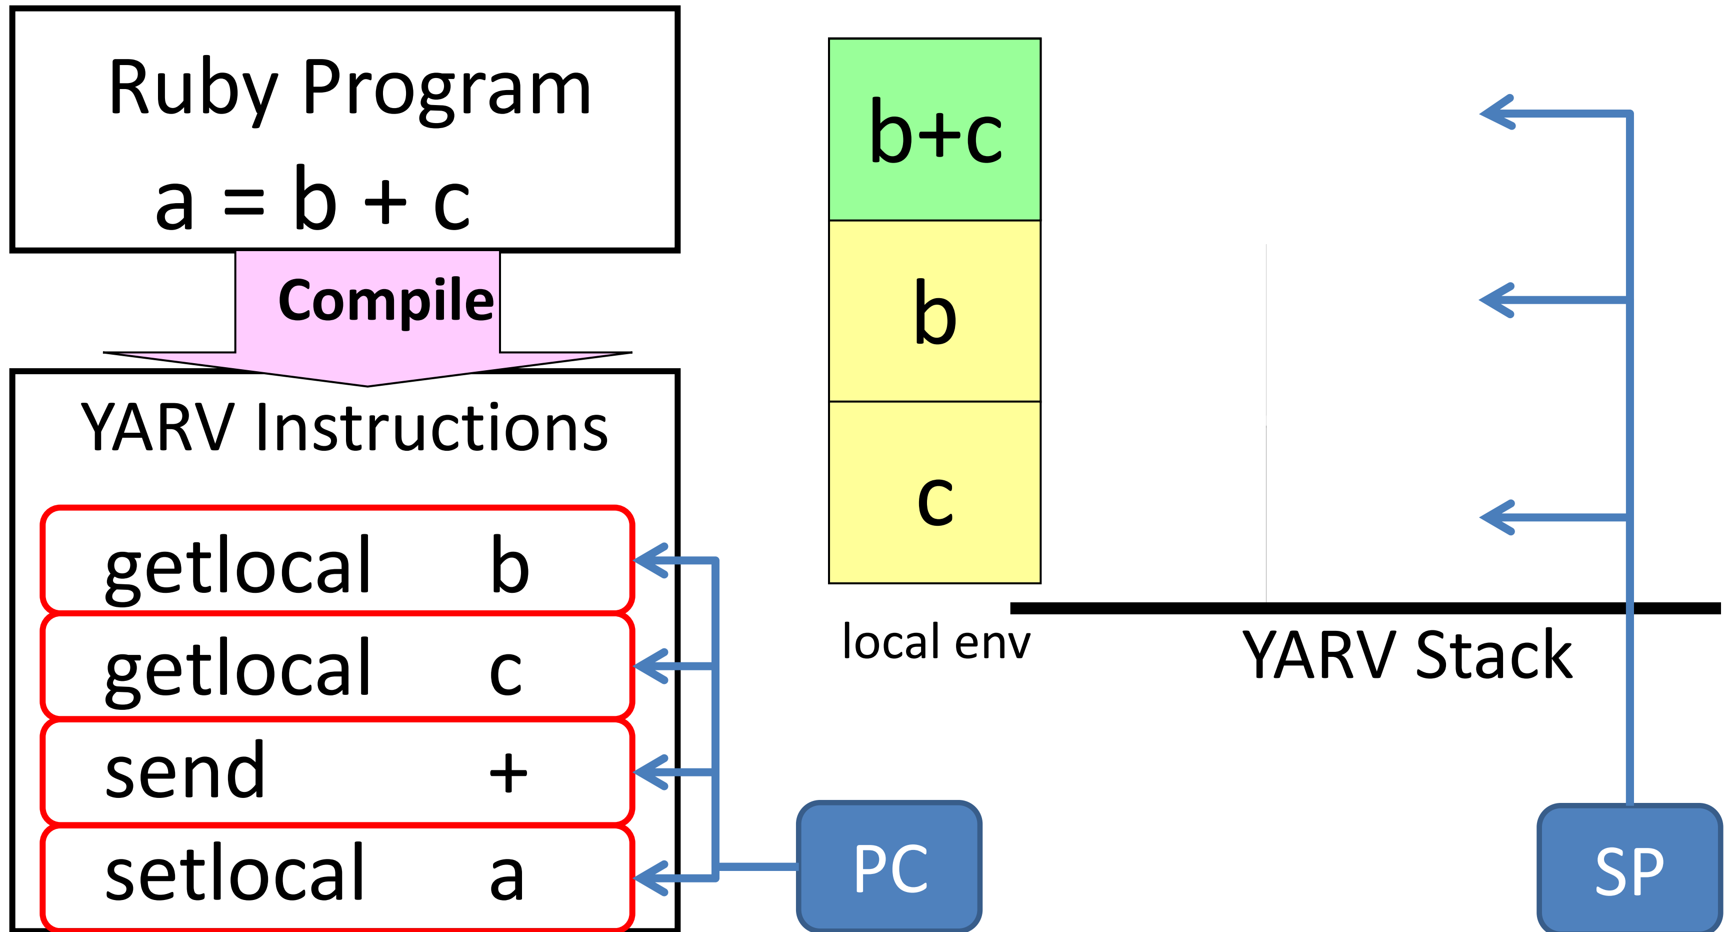
Review slide
Requirement and Assumption

- You need to finish **“Ruby language basic”** course
- This course uses “Ruby” language/interpreter
  - One of the most popular languages
  - Used in world-wide programming
    - Web application
    - Text processing
    - and everything!!
  - CRuby
    - Ruby has many alternative implementations
    - CRuby has their own VM

Review slide
How to implement virtual machine?

- Execute instructions
  - Execute compiled instructions (bytecodes)
  - Pointed by “Program counter” (PC)
- Stack machine architecture
  - All of values on the stack
  - Stack top is pointed by “Stack pointer” (SP)
  - V.S. Register machine architecture
    - Advantages and disadvantages
    - Yunhe Shi, et al: “Virtual machine showdown: stack versus registers” (2005)

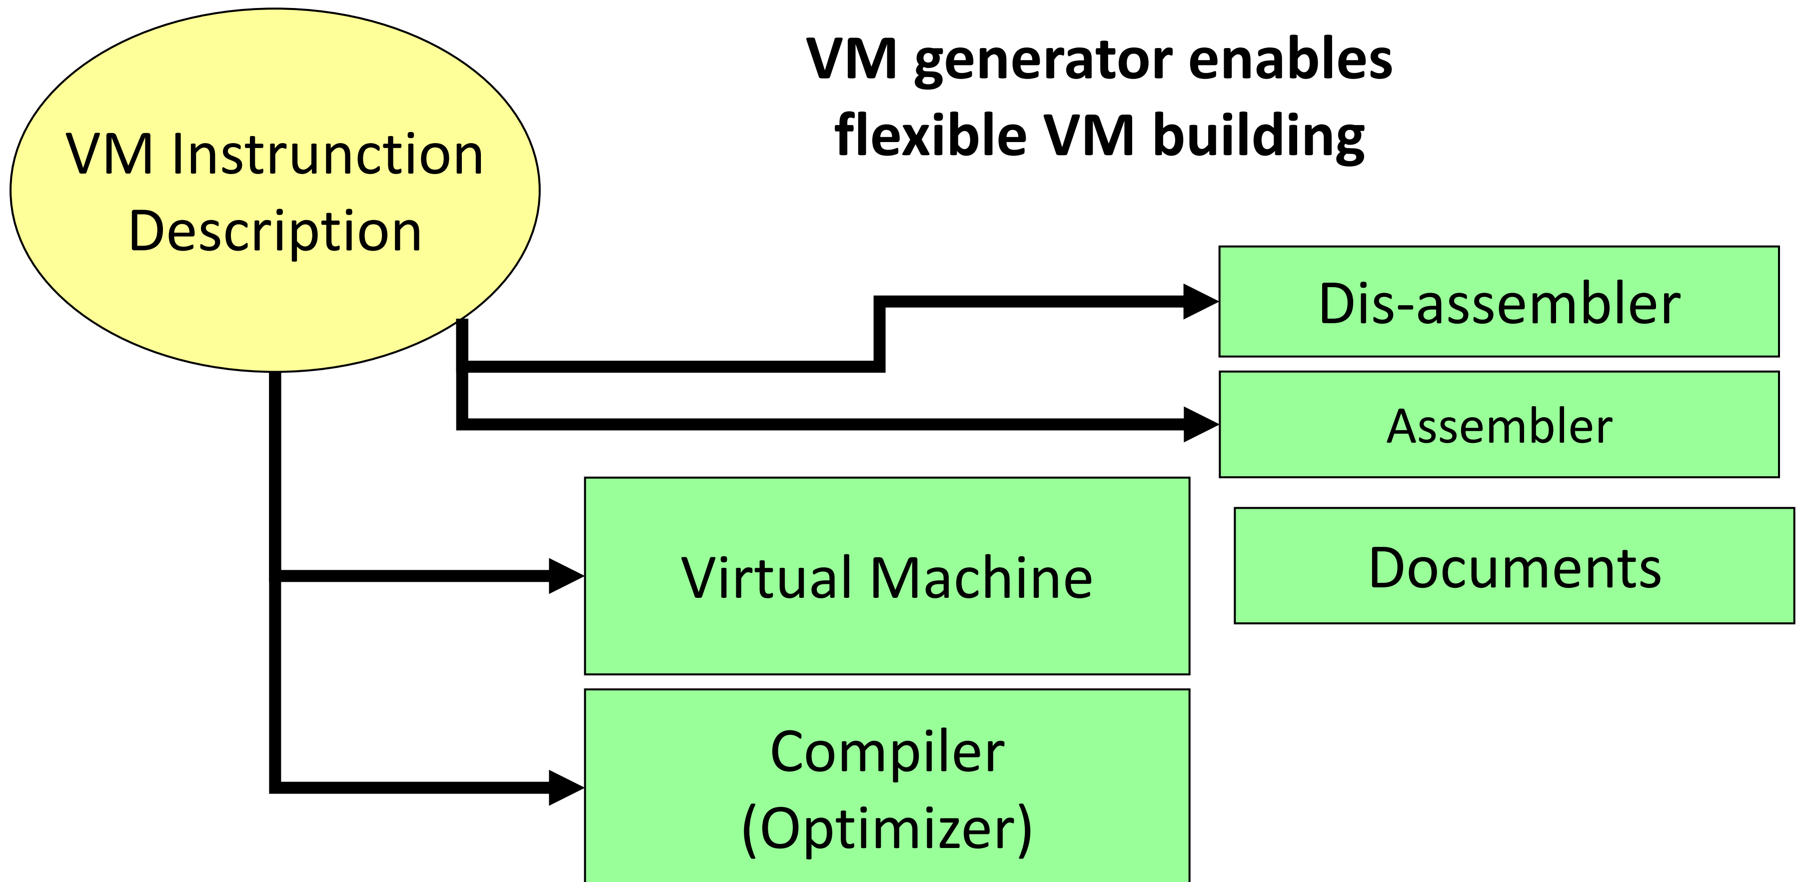
Review slide
Stack machine execution (basic)



Review slide
[Advanced] Optimization techniques

- Peephole optimizations (compiler technique)
  - Reduce instruction number
- Make macro instructions
  - Operand unification
  - Instruction unification
- Direct threading
  - Using GCC specific feature
- Stack caching
  - n-level stack caching
  - Impact on CPU’s branch prediction

Review slide
[Advanced] VM generator



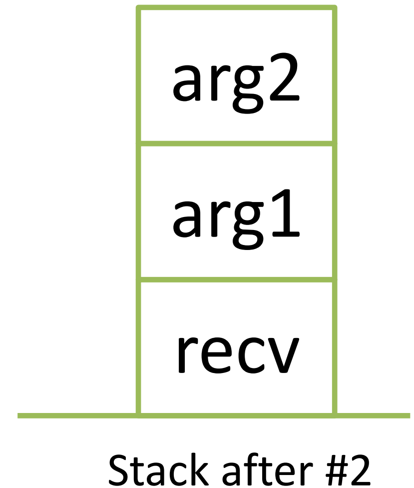
Today's lecture:
Method dispatch

```
# Example
recv.selector(arg1, arg2)
```

- recv: receiver
- selector: method id
- arg1, arg2: arguments

Before method dispatch

1. Evaluate `recv’
2. Evaluate `arg1’ and `arg2’
3. Method dispatch (`selector’)



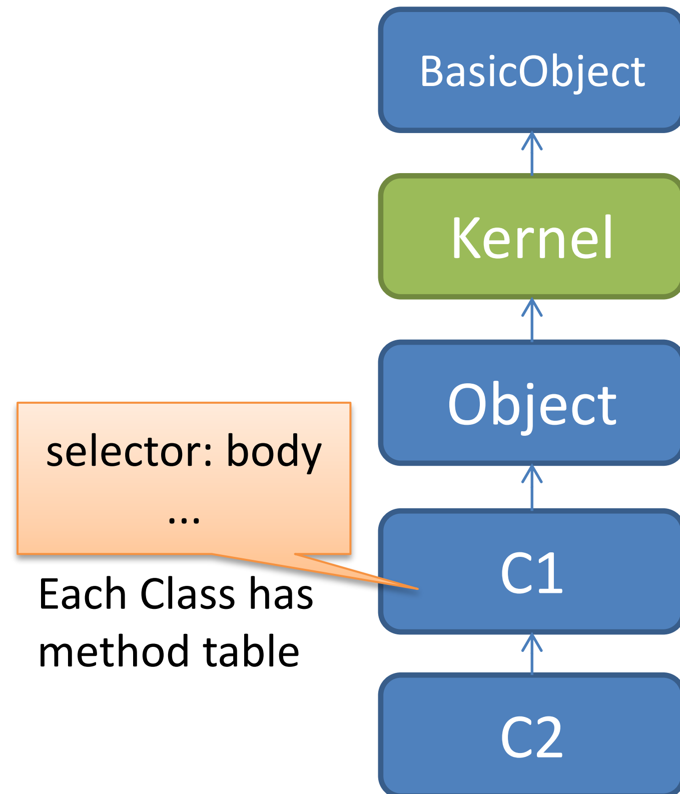
```
# Ruby’s disassembled bytecodes of Ruby 2.0 trunk
0016 getlocal        recv, 0   # 1 receiver
0019 getlocal        arg1, 0  # 2 arg1
0022 getlocal        arg2, 0  # 2 arg2
0025 send            <callinfo!mid:selector, argc:2, ARGS_SKIP>
```

Method dispatch Overview

1. Get class of \`recv’ (\`klass’)
2. Search method \`body’ named \`selector’ from \`klass’
   – Method is not fixed at compile time
   – **“Dynamic”** method dispatch
3. Dispatch method with \`body’
   1. Check visibility
   2. Check arity (expected args # and given args #)
   3. Store \`PC’ and \`SP’ to continue after method returning
   4. Build \`local environment’
   5. Set program counter
4. And continue VM execution

Overview
Method search

- Search method from `klass’
  1. Search method table of `klass’
     1. if method `body’ is found, return `body’
     2. `klass’ = super class of `klass’ and repeat it
  2. If no method is given, exceptional flow
     - In Ruby language, `method_missing’ will be called



Overview
Cheking arity and visibility

- Checking arity
  - Compare with given argument number and expected argument number
- Checking visibility
  - In Ruby language, there are three visibilities (can you explain each of them ?:-p)
    - public
    - private
    - protected

Overview
Building `local environment'

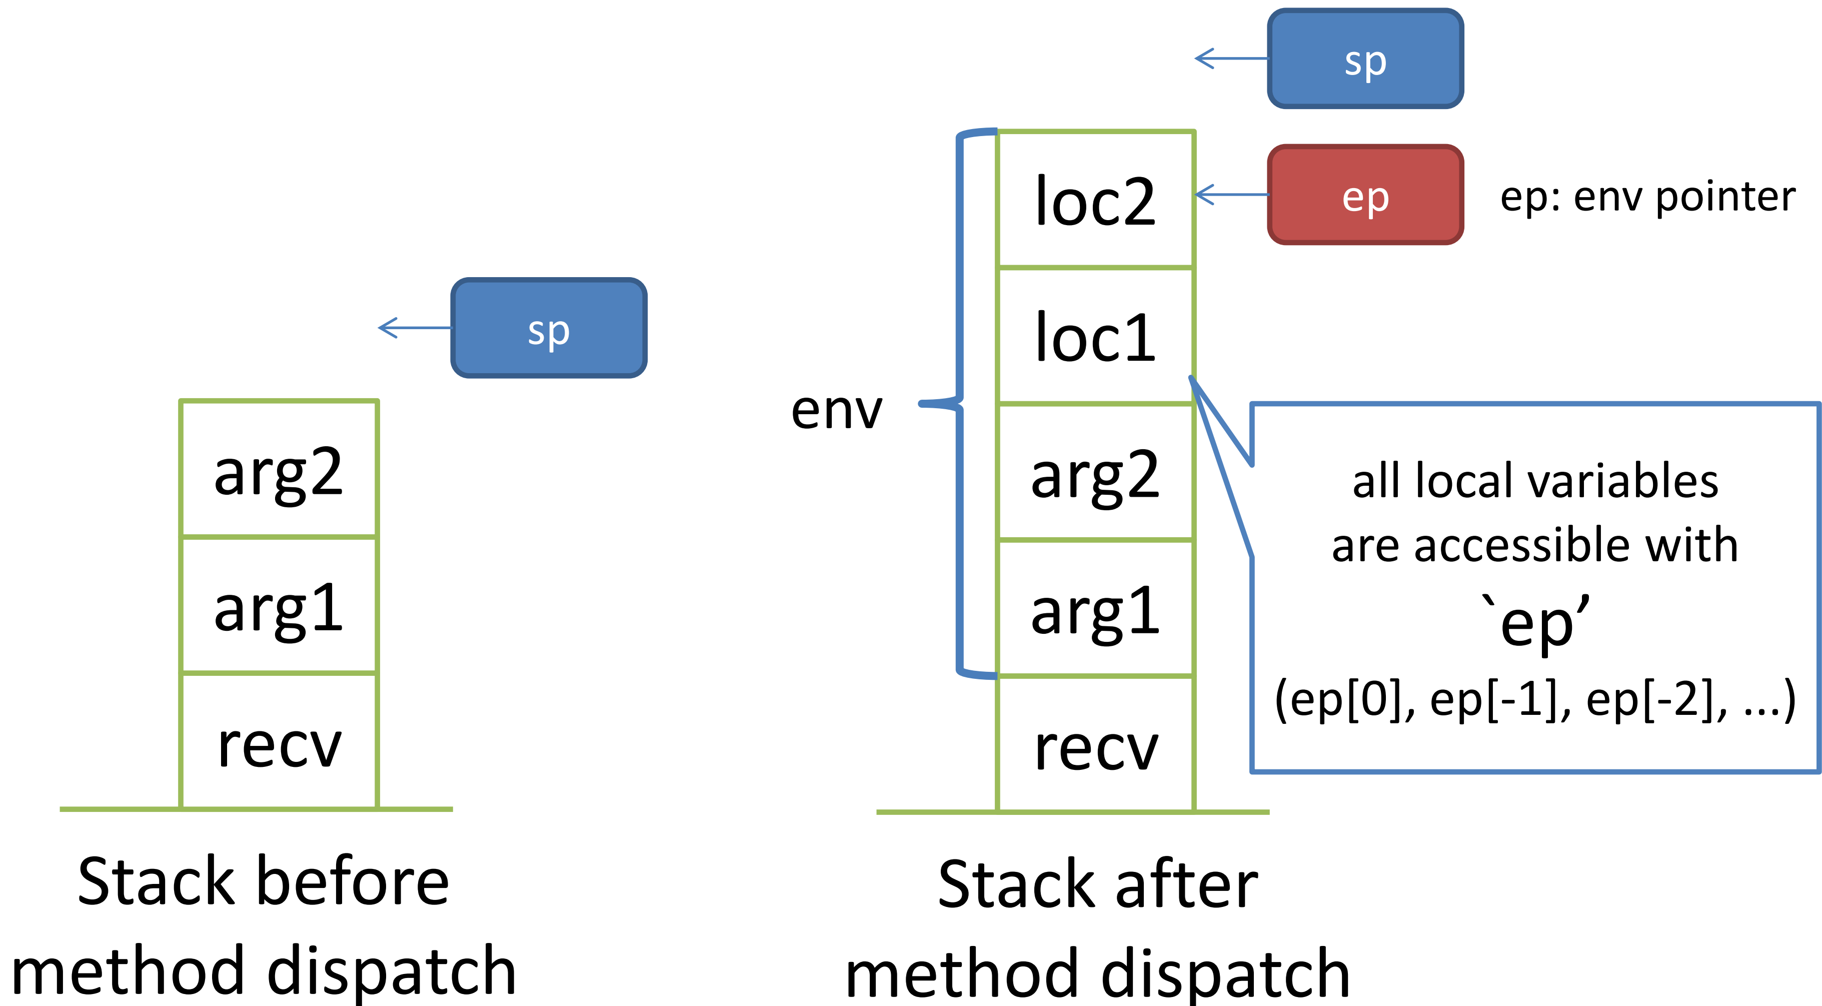
- How to maintain local variables?

→ Prepare `local variables space' in stack

→ `local environment' (short `env')

- Parameters are also in `env'

Overview
Building `local environment’



Method dispatch Overview (again)

1. Get class of `recv’ (`klass’)
2. **Search method `body’ `selector’ from `klass’**
   - Method is not fixed at compile time
   - **“Dynamic”** method dispatch
3. **Dispatch method with `body’**
   1. Check visibility
   2. Check arity (expected args # and given args #)
   3. Store `PC’ and `SP’ to continue after method returning
   4. Build `local environment’
   5. Set program counter
4. And continue VM execution

About 7 steps

It seems very **easy and simple!**
and slow...

Method dispatch Ruby's case

- Quiz: How many steps in Ruby's case?
  - Hint: More complex than I explained overview

① 8 steps

② 12 steps

③ 16 steps

④ 20 steps

Answer is
About ④ 20 steps

Method dispatch
Ruby's case

1. Check caller's arguments
    1. Check splat (*args)
    2. Check block (given by compile time or block parameter (&block))
2. Get class of `recv' (`klass')
3. **Search method `body' `selector' from `klass'**
    - Method is not fixed at compile time
    - **"Dynamic"** method dispatch
4. **Dispatch method with `body'**
    1. Check visibility
    2. Check arity (expected args # and given args #) and process
        1. Post arguments
        2. Optional arguments
        3. Rest argument
        4. Keyword arguments
        5. Block argument
    3. Push new control frame
        1. Store `PC' and `SP' to continue after method returning
        2. Store `block information'
        3. Store `defined class'
        4. Store bytecode info (iseq)
        5. Store recv as self
    4. Build `local environment'
    5. Initialize local variables by `nil'
    6. Set program counter
5. And continue VM execution

(*) Underlined items are additonal process

Ruby's case
4. Dispatch method with `body'

- Previous explanation is for Ruby methods
  - `body' (defined as rb_method_definition_t in method.h) has several types at least the following two types:
    - Method defined by Ruby code
    - Method defined by C function (in C-extension)
- Quiz: How many method types in CRuby?
  - Hint: At least 2 types (Ruby method and C method)

① 3 types
② 6 types
③ 9 types
④ 11 types

Answer is
About ④ 11 types

Ruby's case
Method types

1. VM_METHOD_TYPE_ISEQ: Ruby method (using `def' keyword)
2. VM_METHOD_TYPE_CFUNC: C method
3. VM_METHOD_TYPE_ATTRSET: defined by @attr_accessor
4. VM_METHOD_TYPE_IVAR: defined by @attr_reader
5. VM_METHOD_TYPE_BMETHOD: defind by `define_method'
6. VM_METHOD_TYPE_ZSUPER: used in internal
7. VM_METHOD_TYPE_UNDEF: `undef'ed method
8. VM_METHOD_TYPE_NOTIMPLEMENTED: not implemet
9. VM_METHOD_TYPE_OPTIMIZED: optimization
10. VM_METHOD_TYPE_MISSING: method_missing type
11. VM_METHOD_TYPE_CFUNC_FRAMELESS: optimization two

There are 11th different method dispatch procedure (dispatch by switch/case statement)

Ruby's case

- Quiz: I introduce (virtual) registers `pc', `sp' and `ep'. How many registers in virtual machine (in Ruby 1.9.x)?
  ① 4 registers
  ② 6 registers
  ③ 9 registers
  ④ <u>11 registers</u>

Answer is
About ④ 11 registers
↓
Need to store/restore
11 registers
each method call

Ruby's case
Store registers

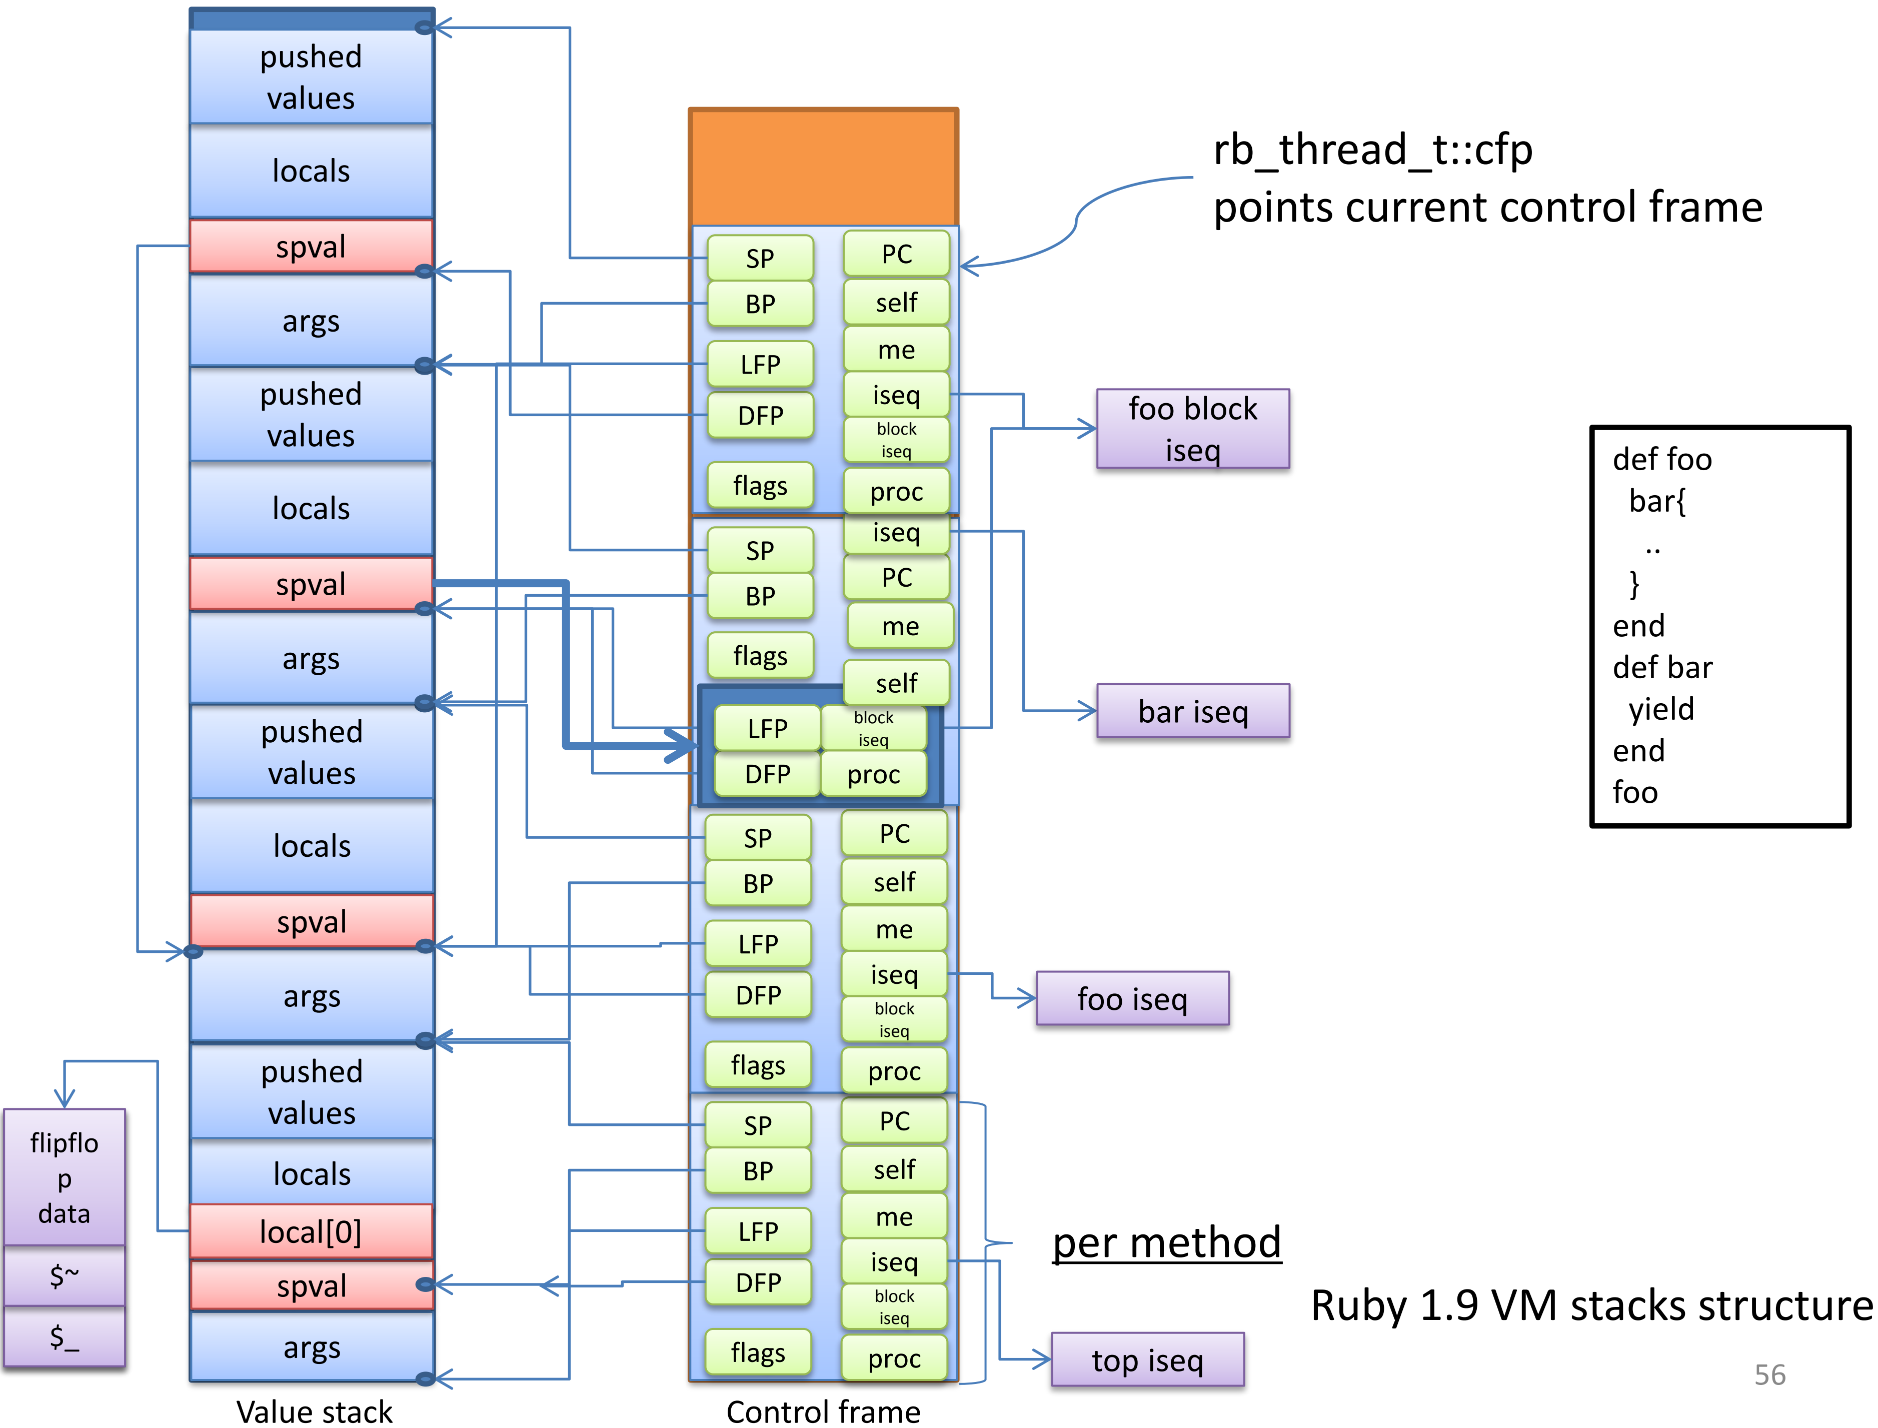
- Introduce "control frame stack" to store registers
  - To store \`pc', \`sp', \`ep' and other information, VM has another stack named "control frame stack"
  - Not required structure, but it makes VM simple → Easy to maintain

11 regs

```
/* 1.9.3 */
typedef struct {
  VALUE *pc;                    /* cfp[0] */
  VALUE *sp;                    /* cfp[1] */
  VALUE *bp;                    /* cfp[2] */
  rb_iseq_t *iseq;              /* cfp[3] */
  VALUE flag;                   /* cfp[4] */
  VALUE self;                   /* cfp[5] / block[0] */
  VALUE *lfp;                   /* cfp[6] / block[1] */
  VALUE *dfp;                   /* cfp[7] / block[2] */
  rb_iseq_t *block_iseq;        /* cfp[8] / block[3] */
  VALUE proc;                   /* cfp[9] / block[4] */
  const rb_method_entry_t *me;/* cfp[10] */
} rb_control_frame_t;
```

10 regs
reduced, but many yet

```
/* 2.0 */
typedef struct {
  VALUE *pc;                    /* cfp[0] */
  VALUE *sp;                    /* cfp[1] */
  rb_iseq_t *iseq;              /* cfp[2] */
  VALUE flag;                   /* cfp[3] */
  VALUE self;                   /* cfp[4] / block[0] */
  VALUE klass;                  /* cfp[5] / block[1] */
  VALUE *ep;                    /* cfp[6] / block[2] */
  rb_iseq_t *block_iseq;        /* cfp[7] / block[3] */
  VALUE proc;                   /* cfp[8] / block[4] */
  const rb_method_entry_t *me;/* cfp[9] */
}
```



Ruby 1.9 VM stacks structure

Ruby’s case
Complex parameter checking

- “def foo(m1, m2, o1=..., o2=...,
  p1, p2, *rest, &block)”
  - m1, m2: mandatory parameter
  - o1, o2: optional parameter
  - p1, p2: post parameter
  - rest: rest parameter
  - block: block parameter
- From Ruby 2.0, keyword parameter is supported

Method dispatch
Ruby's case

1. CHeck caller's arguments
   1. Check splat (*args)
   2. Check block (given by compile time or block parameter (&block))
2. Get class of `recv' (`klass')
3. **Search method `body' `selector' from `klass'**
   – Method is not fixed at compile time
   – **"Dynamic"** method dispatch
4. **Dispatch method with `body'**
   1. Check visibility
   2. Check arity (expected args # and given args #) and process
      1. Post arguments
      2. Optional arguments
      3. Rest argument
      4. Keyword arguments
      5. Block argument
   3. Push new control frame
      1. Store `PC' and `SP' to continue after method returning
      2. Store `block information'
      3. Store `defined class'
      4. Store bytecode info (iseq)
      5. Store recv as self
   4. Build `local environment'
   5. Initialize local variables by `nil'
   6. Set program counter
5. And continue VM execution

Method dispatch Overhead

Method dispatch overhead is big especially on micro-benchmarks ☺

Homework

- Report about “Method Dispatch speedup techniques”
  1. Analyze method dispatch overhead on your favorite application
  2. Survey method dispatch speed-up techniques
  3. Propose your optimization techniques to improve method dispatch performance
  4. Implement techniques and evaluate their performance

- Deadline: 2012/12/23 (Sun) 23:59 JST
- Submit to: Koichi Sasada <ko1@rvm.jp>
- This report is important for your grade of this course!

Lecture was finished ☺

Presentation is not finished

Back to the presentation "Implementation Details of Ruby 2.0 VM"

Report "Optimization techniques for Ruby's method dispatch"

Koichi Sasada

Speedup techniques for method dispatch

1. Specialized instructions
2. Method caching
3. Caching checking results
4. Frameless CFUNC method
5. Special path for `send' and `method_missing'

Note that these optimizations may not be my original.

Introduced techniques from Ruby 2.0
Today's main subject ☺

Method dispatch overheads

1. Check caller's arguments
2. Search method `body' `selector' from `klass'
3. Dispatch method with `body'
   1. Check visibility and arity
   2. Push new control frame
   3. Build `local environment'
   4. Initialize local variables by `nil'

Optimization
Specialized instruction (from 1.9)

- Make special VM instruction for several methods
  - +, -, *, /, …

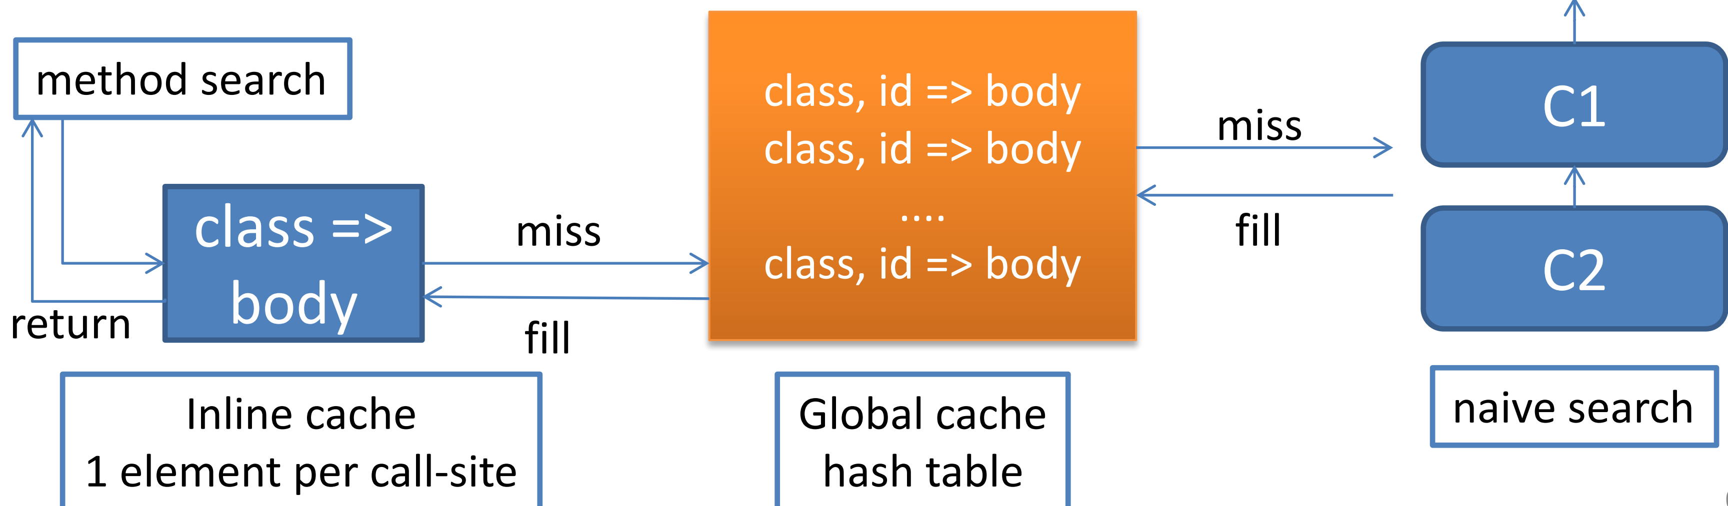
```
def opt_plus(recv, obj)
  if recv.is_a(Fixnum) and obj.is_a(Fixnum) and
      Fixnum#+ is not redefined
      return Fixnum.plus(recv, obj)
  else
    return recv.send(:+, obj) # not prepared
  end
end
```

Optimization
Specialized instruction

- Pros.
  - Eliminate all of dispatch cost **(very effective)**
- Cons.
  - Limited applicability
    - Limited classes, limited selectors
    - Tradeoff of VM instruction numbers
  - Additional overhead when not prepared class

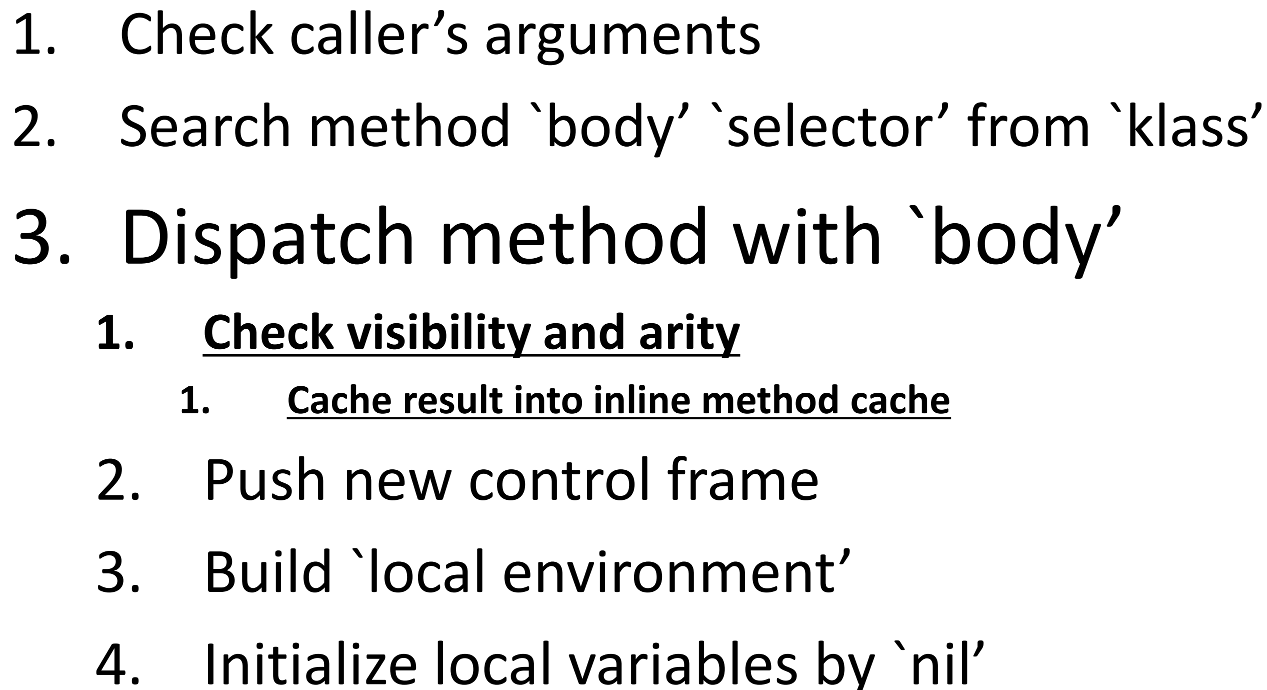
Optimization
Method caching

- **Eliminate method search overhead**
  - Reuse search result
  - Invalidate cache entry with VM stat
- Two level method caching
  - Inline method caching
  - Global method caching



Optimization
Caching checking results (from 2.0)

- Idea: Visibility and arity check can be skipped after first checking
  - Store result in inline method cache



Optimization
Frameless CFUNC (from 2.0)

- Introduce "Frameless" CFUNC methods
  - Idea: Several CFUNC doesn't need method frame
    - For example, String#length doesn't need method frame. It only return the size of given String

1. Check caller's arguments
2. Search method `body' `selector' from `klass'
3. Dispatch method with `body'
   1. Check visibility and arity
   2. **Push new control frame**
   3. **Build `local environment'**
   4. **Initialize local variables by `nil'**

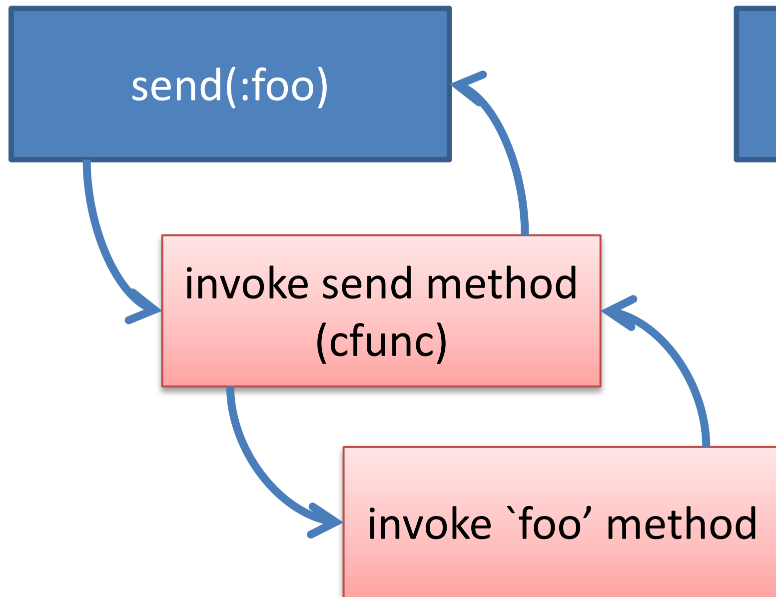
Optimization
Eliminate frame building (from 2.0)

- Compare with specialized instruction
  - Pros.
    - You can define unlimited number of frameless methods
  - Cons.
    - A bit slow compare with specialized instruction
- Note that evaluation result I will show you doesn’t include this technique

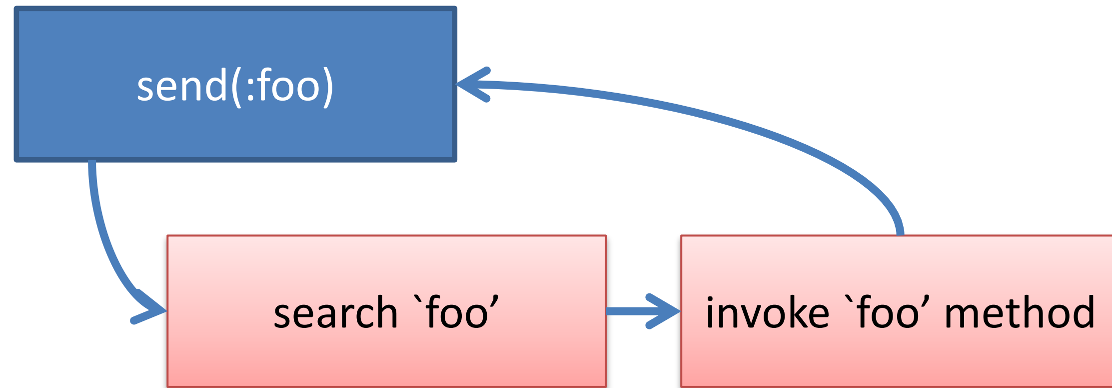
Optimization

Special path for `send' and `method_missing' (from2.0)

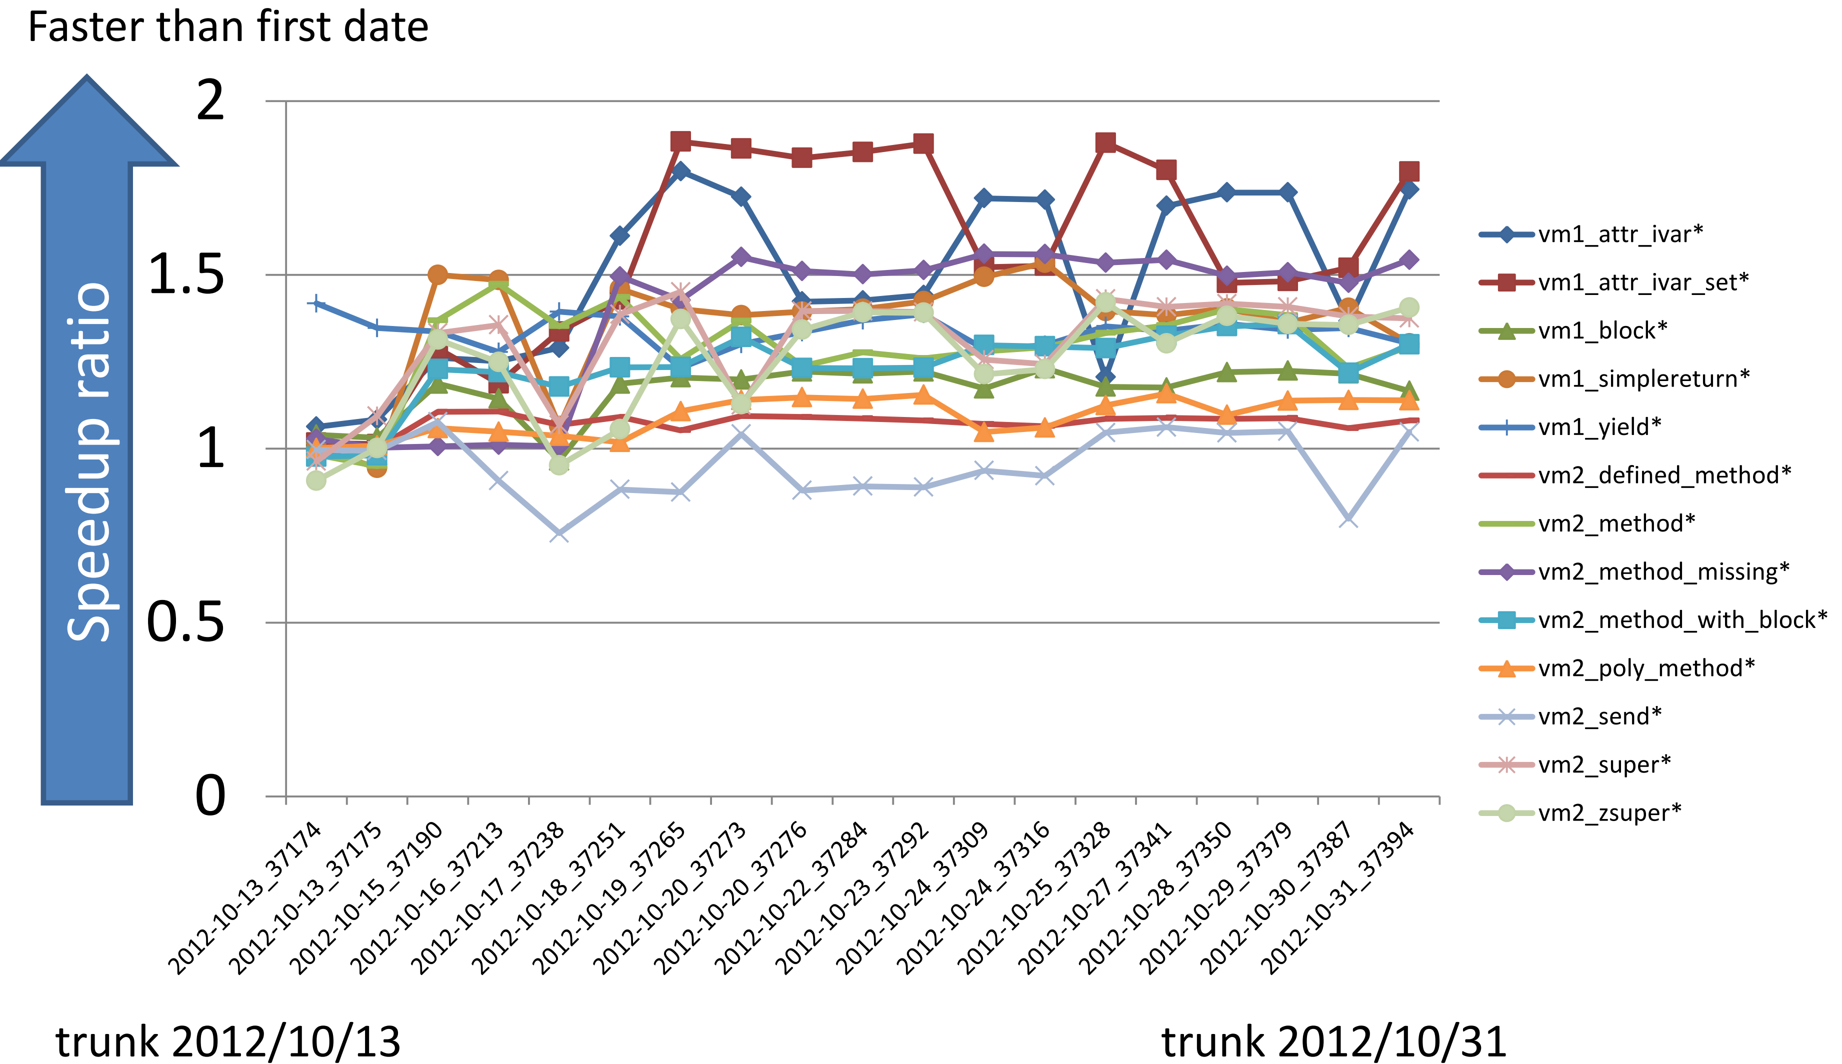
Before



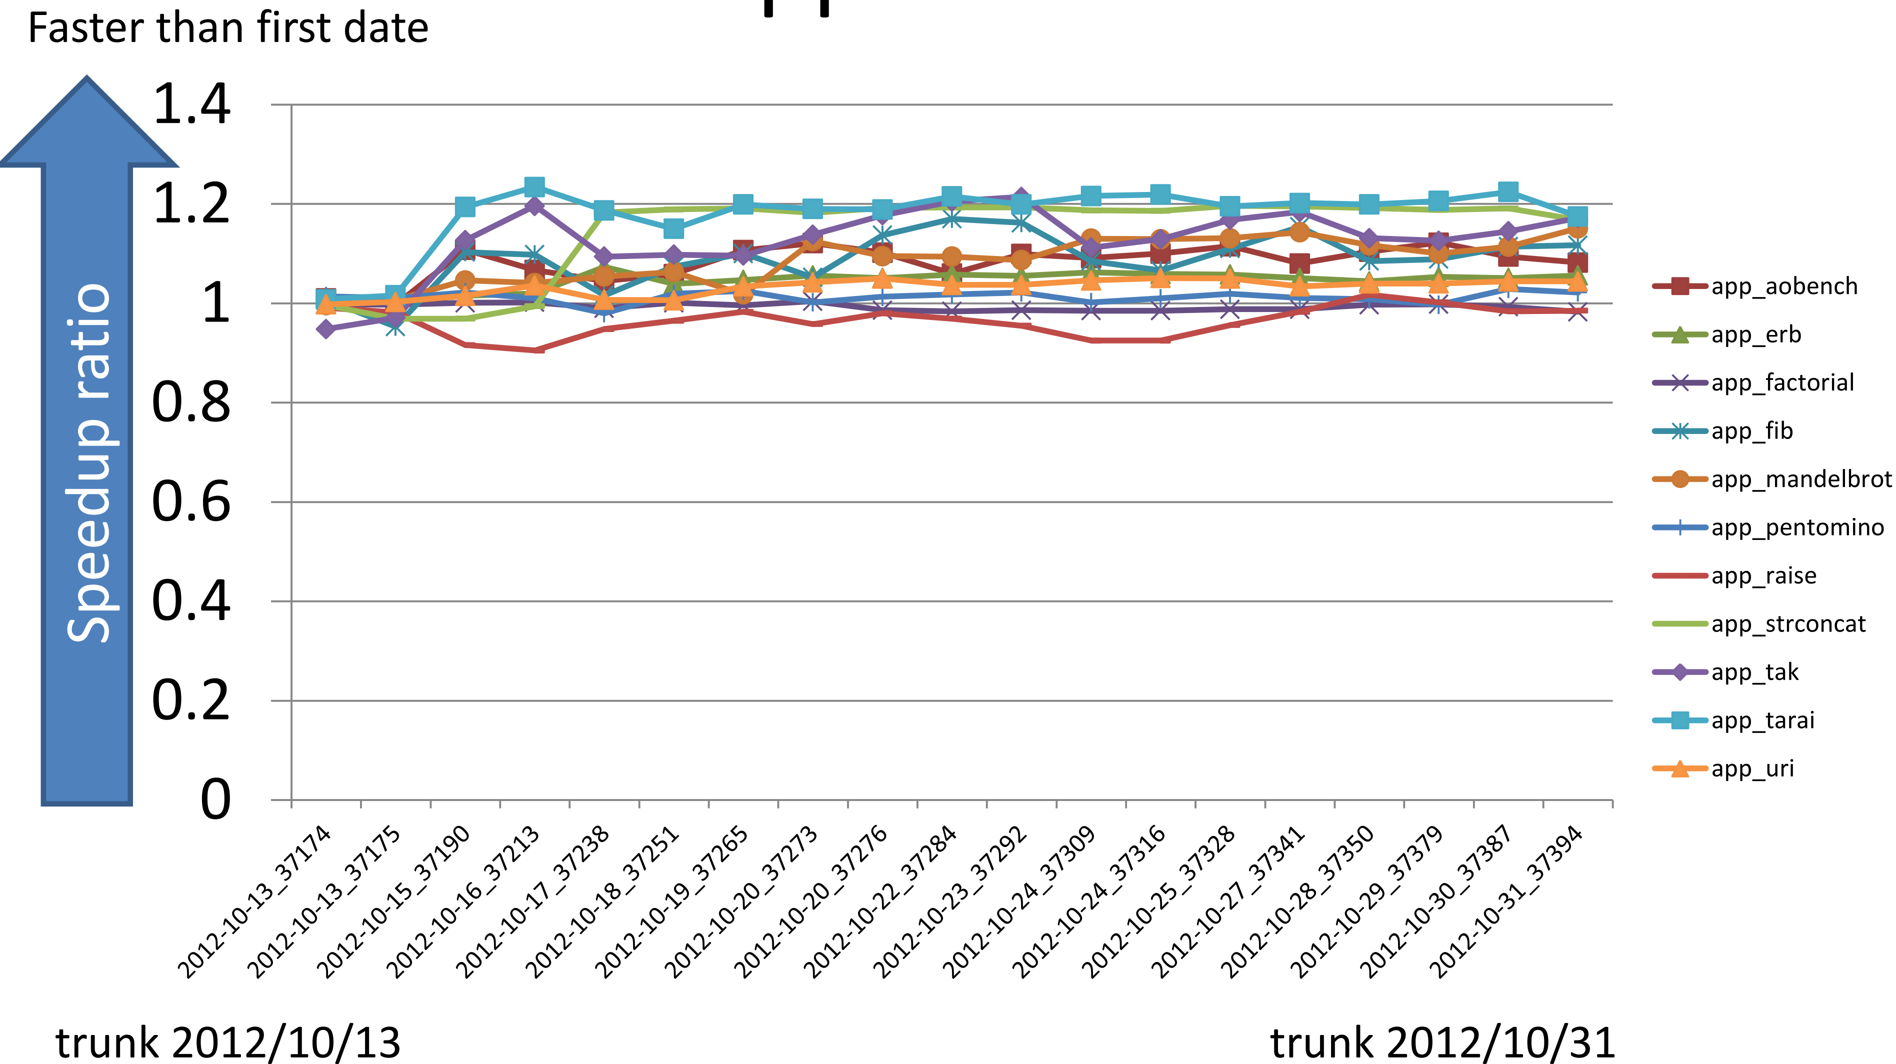
After



Evaluation result
Micro benchmarks



Evaluation results Applications



Future work

- Restructure “method frame”
  - Reduce required information per frame
- Improve “yield” performance
  - Using something cached

Conclusion

Method dispatch speed-up

- Ruby's method dispatch is nightmare
  - Too complex
- Speedup upto 50% at simple method dispatch with new optimizations
- Need more effort to achieve performance improvements

Other optimizations from 2.0

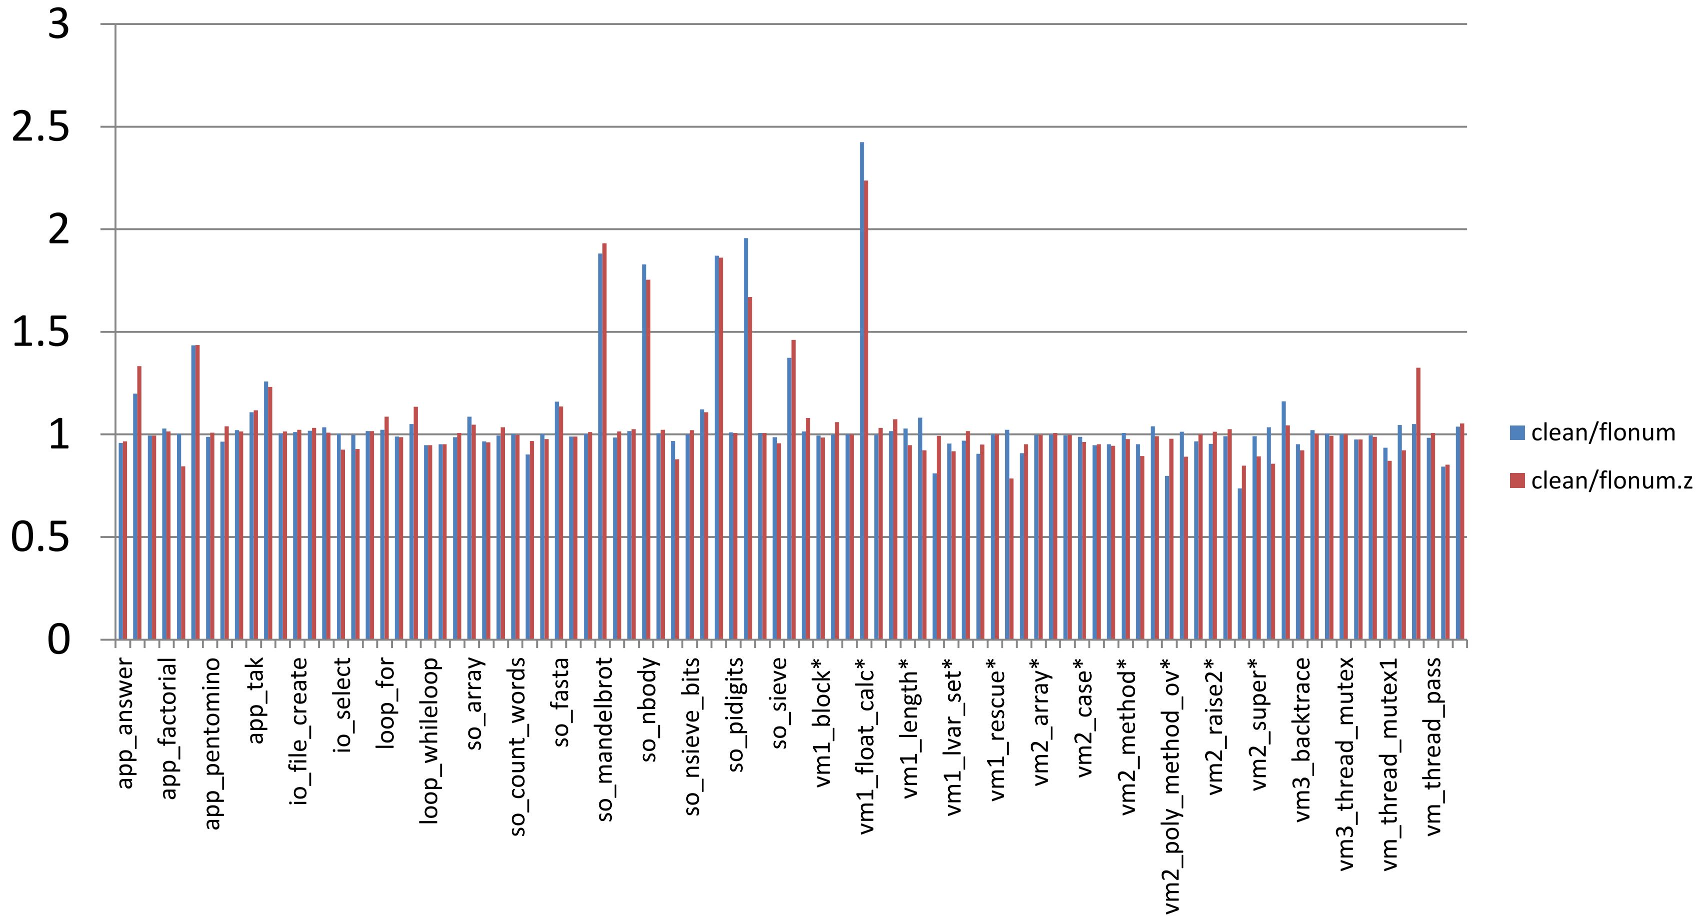
- Introducing Flonum (only on 64bit OSs)
- Lightweight Backtrace capturing
- Re-structure VM stacks/ISeq data

- Bitmap marking garbage collection (by nari3)
- “require” performance (not by me)

Introducing Flonum
(only on 64bit CPU)

- Problem: Float objects are not immediate on Ruby 1.9
  - It causes GC overhead problem
- **To speedup floating calculation, represent Float object as immediate object**
  - Specified range Float objects are represented as immediate object (Flonum) like Fixnum
    - 1.72723e-77 < |f| < 1.15792e+77 (approximately) and +0.0
    - Out of this range and all Floats on 32bit CPU are allocated in heap
  - No more GCs! (in most of case)
  - Flonum and old Float are also Float classes
  - Proposed by [K.Sasada 2008]
  - On 64bit CPU, object representation was changed

Benchmark results



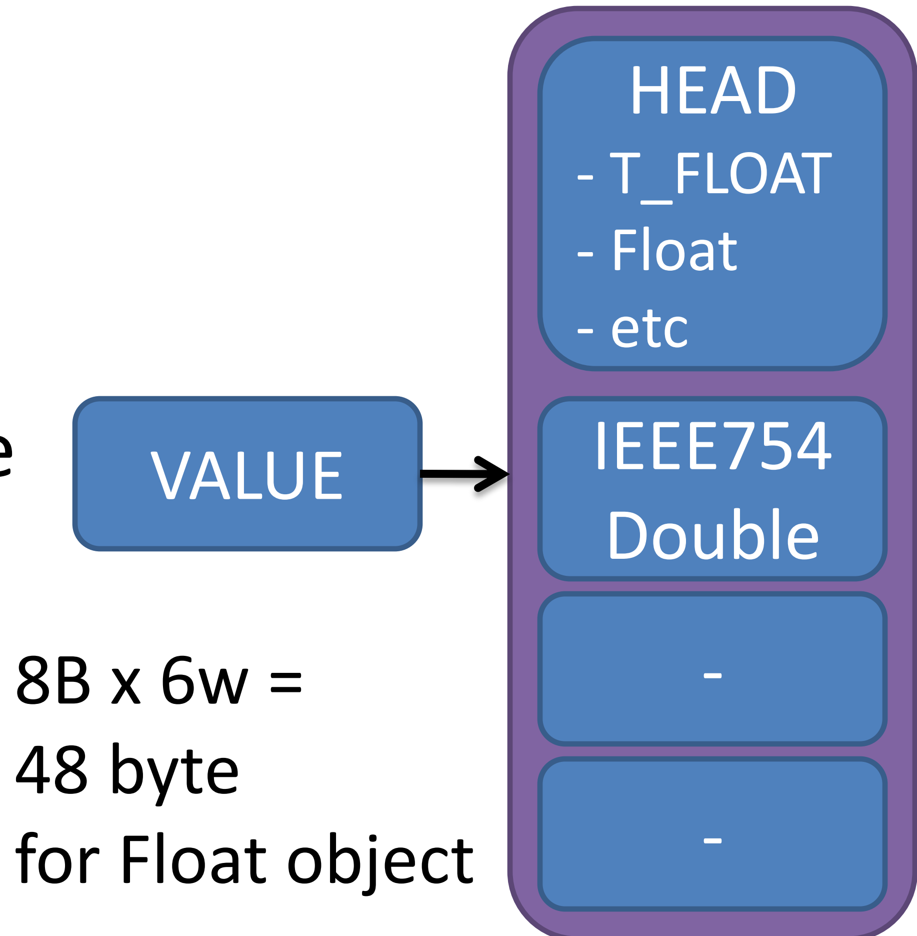
Flonum: Float in Heap (1.9 or before)

All of Float object

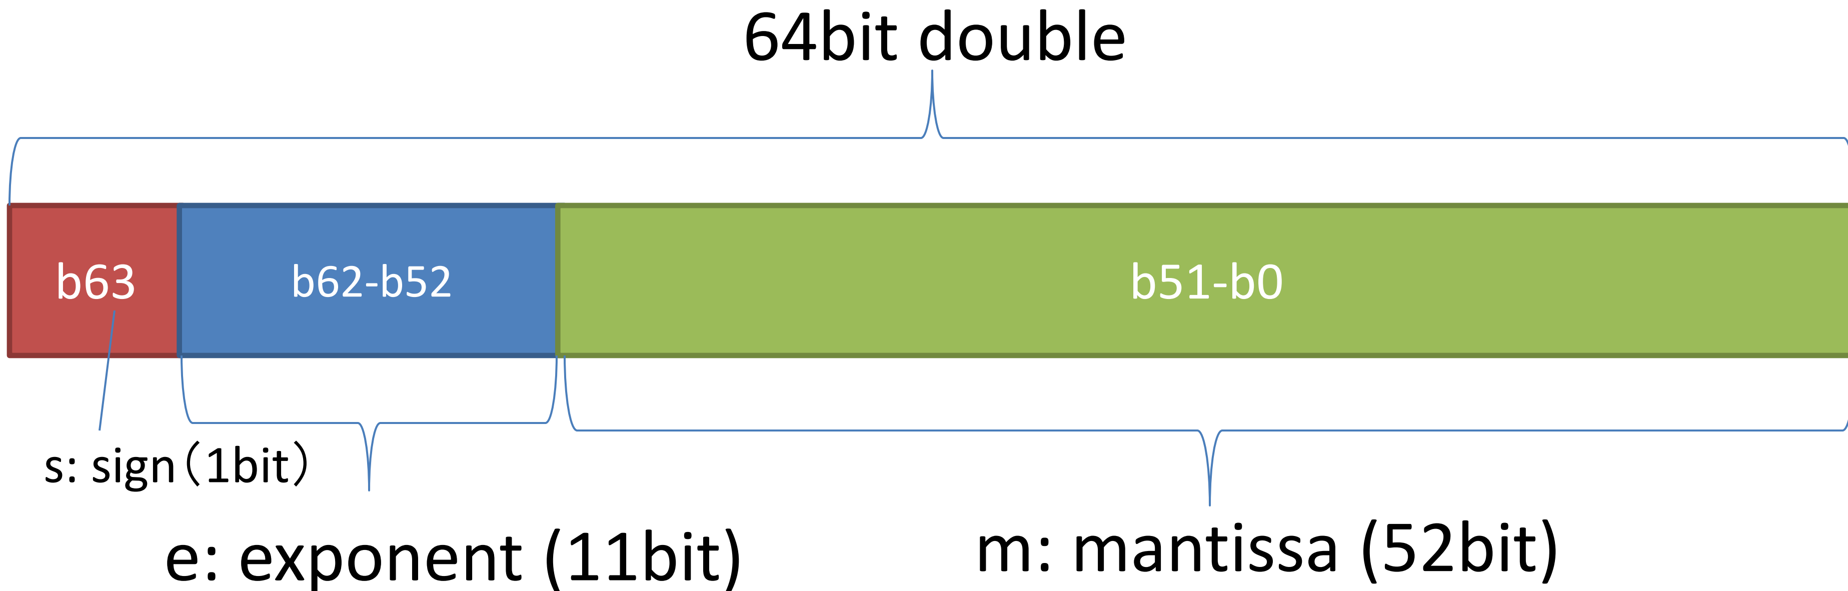
are allocated in heap

Data structure in heap

contains IEEE754/double



Flonum: Encoding
IEEE754 double floating number



$$-1^{s}2^{e-1024}m \quad (m = 1 + \Sigma_{i=0}^{51} \frac{b_i}{2^{52-i}})$$

Flonum: Range

Check if e (b52 to b62) is with-in 768 to 1279, then it can be represent in Flonum.

This check can be done with b60-b62.

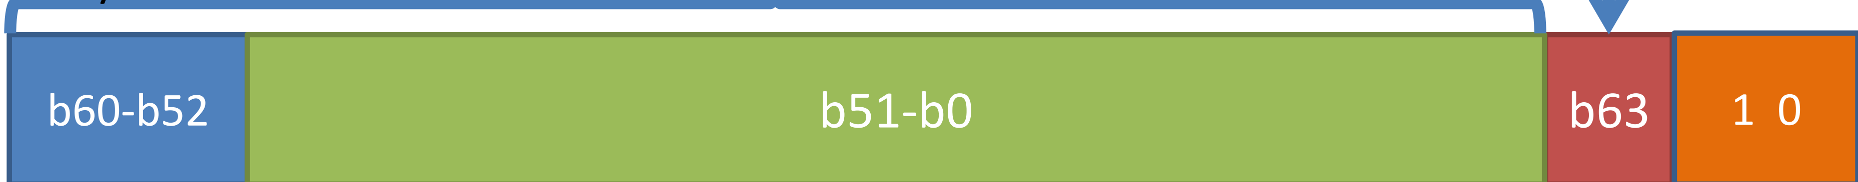
(+0.0 (0x00) is special case to detect)

Flonum: Encoding

IEEE754 double

Only “rotate” and “mask”

Ruby’s Flonum



Flonum representation bits (2 bits)
#define FLONUM_P(v) ((v&3) == 2)

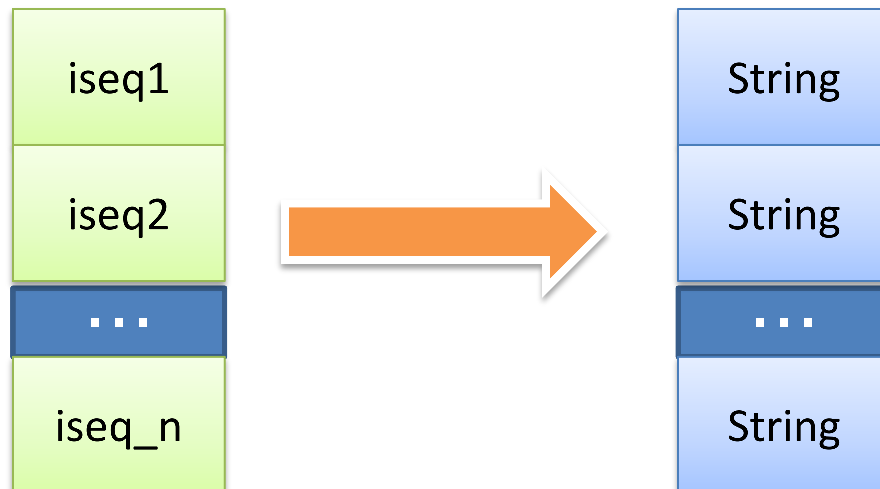
☆ +0.0 is special case (0x02)

Flonum: Object representation on VALUE

	Non Flonum	Flonum
Fixnum	...xxxx xxx1	...xxxx xxx1
Flonum	N/A	...xxxx xx10
Symbol	...xxxx 0000 1110	...xxxx 0000 1100
Qfalse	...0000 0000	...0000 0000
Qnil	...0000 0100	...0000 1000
Qtrue	...0000 0010	...0001 0100
Qundef	...0000 0110	...0011 0100
Pointer	...xxxx xx00	....xxxx x000

Lightweight Backtrace capturing

- Backtrace is Array of String objects
  - [“file:lineno method”, ...]
- Idea: Capture only ISeqs and translate to String (file and line) only when it is accessed
  - Backtrace information may be ignored

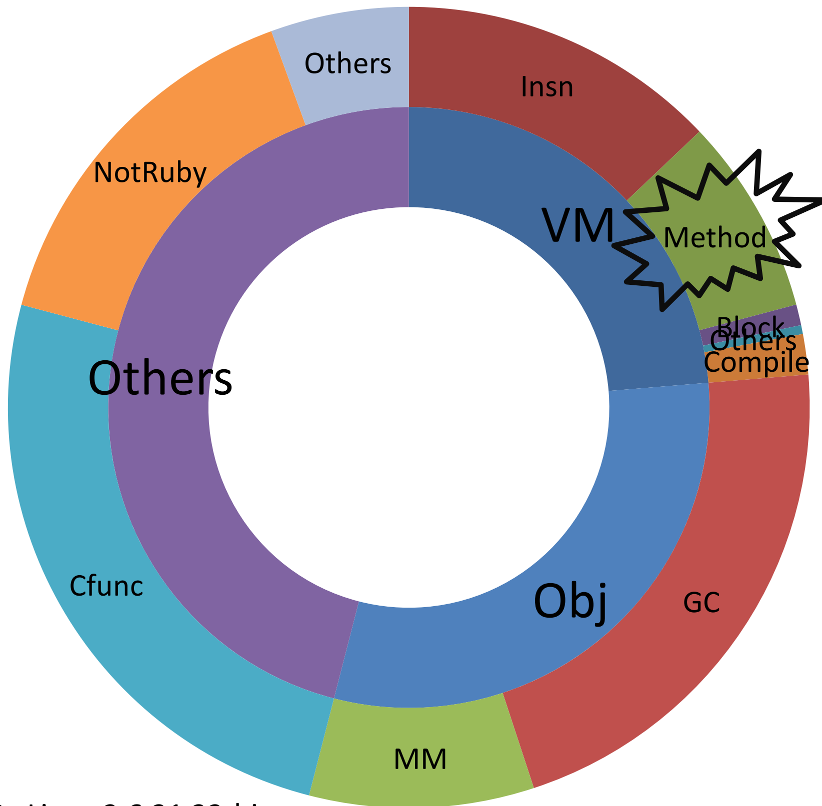


After Ruby 2.0

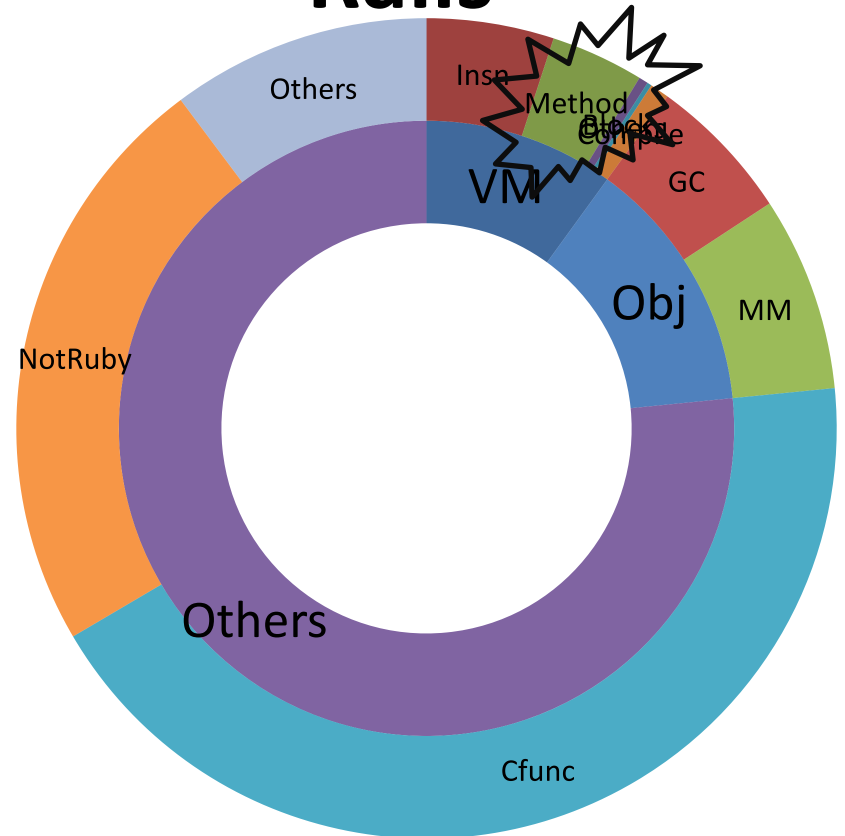
What we should do?

Performance overhead

rdoc



Rails



OS: Linux 2.6.31 32-bit
CPU: IntelCore2Quad 2.66GHz
Mem: 4GB
C Compiler: GCC 4.4.1, -O3
Profiled by Oprofile

ruby 1.9.3dev (2010-05-26)
Profiled by Mr. Shiba

VM techniques

- On Rails and other applications, VM is not an bottleneck
- On Mathematic, Symbolic computation, VM is matter
  - To speedup then, we need compilation framework
    - 2.0?

Object Allocation and garbage collection

- Lightweight object allocation
  - Sophisticate object creation
  - Create objects in non-GC managed area
- Sophisticate Garbage collection
  - Per-type garbage collection
  - Generational garbage collection
    - Introduce write barriers with dependable techniques

Parallelization

- Multiple processes
- Multiple VMs
- Multiple Threads

No time and space to discuss about them!

Conclusion

Conclusion

Our challenge has just begun!!

俺たちの戦いはまだ始まったばかりだ!

謝謝
Thank you for your attention
